# The C-Section

The phone rang. It was four o'clock... the  
other four o'clock.

A worried voice came on the line, "Sorry to  
wake ya, Doc,

But I've got a calvy heifer I think's in trouble,  
some.

I can't see nothin' but the tail. I'm wonderin',  
could ya come?"

Next thing I know I'm in his barn and starin' at  
this beast.

Ten feet tall, she was, I swear, and big as a  
bus, at least.

I laid a ladder 'gainst her flank. A C-section, I  
decide.

After proper preparations there's a window in  
her side.

I poke my head inside the hole to have a look  
around

A pair of parakeets fly out and flutter to the  
ground.

Followed by a barkin' dog and blur of Gambel's  
quail.

A hunter in fluorescent orange, hot on the  
covey' tail.

I climbed on in and smelled the air. No doubt,  
Progesterone.

I leaned against the rumen wall and heard a  
slide trombone!

A corps of cuds came chomping by in step with  
a marching band

All tooting on a catheter. I was Alice in  
Kidneyland.

A school of pies came slicing by: meringues,  
mangos and minces

And dignitaries like the Queen and Michigan  
Pork Princess.

A set of Holstein heifers with their tassels all  
a'twirl.

The Sheep Producer's lobbyist and Snap On  
calendar girl.

On they came, the A.I. techs with pipette fife  
and drum,

A pair of unborn senators, Fetaldee and  
Fetaldum.

This entire cast of characters was headed for  
the womb

And ridin' drag in this parade was me behind  
a broom.

I passed a Winchell's Donut Shop at Pancreas  
and Colon

And saw a New Ages singles group reliving  
lives and trollin'

Then took a left on Ileum and asked the Pelvic  
Nerve

Where I could find the Uterus, His Dendrite  
made a curve

And pointed to the Oviduct that seemed to  
swing and sway.

I saw a blinking neon sign, said **BABY CALF  
THIS WAY.**

The cotyledons bumped my head and as I went  
sliding' down

"There he is," I said, at last. The calf had run,  
aground.

I hefted up a cloven hoof and started for the  
door.

Then like a flash the lights came on! I slipped  
upon the floor,

A scream like I ain't never heard was ringin' in  
my head.

I opened up my eyes and saw me standing' by  
my bed.

My wife was clingin' to the post and tangled in  
the sheets

The slide trombone had died away as had the  
parakeets.

I slowly came awake to find my dream had gone  
kaput.

I looked down at her layin' there and let go of  
her foot!

# Introduction - 3rd & 4th Editions

---

Like all infants, this book has grown into a more complete and usable clinical reference. Most of the changes made to the 3rd and 4th editions were of the "editing" kind. New references were added and updated, along with a few conditions not included in the second edition. "Student's" was dropped from the original title as practitioners have found it a useful addition to their clinic; those initially using it now practicing what they learned. It is hoped that it will be useful to all who endeavor to do just that, practice.

Susan Pasquini

# Introduction - 2nd Edition

---

This second edition is the result of pretending to be a senior vet student and using the first edition. Obvious holes became evident and the other students preferred the more completeness of the "Equine Guide". New Additions:

Over 360 conditions have been added to the first edition

A toxicology chapter and a differential diagnosis chapter have been added

New references have been added under each new condition

A new summary box in the lower left corner has been added to important conditions, for a qui

Stars have been added under the references to indicate prevalence of each condition

\*\*\* = seen once a month

\*\* = seen once a year

\* = maybe once a lifetime. This will vary depending on region of the country

Chapter index on first page of each chapter

Dr. John Kirkpatrick and I read through the whole text. He added his practical knowledge and the "stars" for prevalence of each condition.

Dr. Gregor Morgan read the reproduction section.

The mass of information is overwhelming and this is only one of the many species you are expected to know. Who's kidding who? Veterinary schools are trying, but coming far short of helping the student get a handle on all this material. Traditionally the first 3 years are spent in classrooms cramming information. It is said that these years are to teach students how to look up information; you learn when you get out in practice. The student would be better served by exposure to the clinics at least part time all four years. If your school doesn't do this formally, take it upon yourselves. This guide will hopefully help you do this. Spend time in the clinics so that the different conditions have a "face". You need to see the conditions, not just copy down a list of symptoms to learn. Blowey & Weaver's *Color Atlas of Diseases & Disorders of Cattle* is a way to put pictures to the conditions. Hopefully this guide will open up the clinics for the lower classmen without trying to read an incomprehensible 200

Condition

References: See inside front cover

Facts/Cause: Important information (Cause, Pathophysiology, Hx (history), Incubation period (IP), Transmission, etc.)

Presentation/CS: clinical signs that can be visualized from a distance, or that owner might report

Diagnosis: CS (clinical signs) found by palpation, auscultation, lab tests, postmortem [PM], etc.)

Treatment

 \*\* = See once a year  
 \* = Maybe once a lifetime

**Summary Box: Key words**

**DDx: Differential diagnosis**

**Prognosis (Px):**

- Good
- Guarded
- Poor
- Grave

page chart. Examine an animal in the clinic at your level of knowledge. Pretend you are the veterinarian in charge. Find in the animal's chart the physical exam finding and the differential diagnosis. Think about these. Check the diagnosis and look up the condition in this guide. Then see if you can detect any of the clinical signs. Hold the medicine being used and imagine yourself administering it. Guess if the animal will survive. Check on its progress over time, refreshing your memory with the guide and other texts if you have the time, over and over. Later in lectures, when a condition comes up, you will have a specific animal that relates to it. Then read about each condition over and over again, even if you just scan the texts.

## Introduction - 1st Edition

---

*Student's Guide to Bovine Clinics* is a quick reference guide for veterinary students. It should be especially helpful during the senior year in clinics.

The idea for this guide comes directly from Heidi Tschauner's *Senior Veterinary Student's Guide to Small Animal Clinics*. Dr. Tschauner compiled her guide as a senior veterinary student to help her assess cases quickly until a more thorough reference could be located. These pocket-sized guides are compiled by many senior students to provide quick references for pertinent veterinary facts. Heidi's idea was for seniors to help revise her book to help other veterinary students. Once Heidi put all the information in the computer, Susan Pasquini (my wife) and I arranged it into charts and Sudz Publishing published it. Its instant success has been exciting:

For the last two semesters Susan has been in her junior year of veterinary school. She brought her portable computer to class and typed the large animal medicine and surgery lectures. I then tightened them using the *Merck Manual*, *Smith's Large Animal Internal Medicine* and a number of surgery texts, and put them into chart form. Susan would proof read and correct the charts. Then before her tests we would study from them, correcting and clarifying as we did so. This coming year I am going to pretend to be a senior again (most fun year in veterinary school!) and wander around the clinics with Susan to judge and revise the guides.

This deviates from Heidi's idea of seniors making life easier for other seniors. Our rationalization is, having been out of veterinary school for thirteen years making anatomy books, I've forgotten most of this information, thus the guide will give a quick and complete review. The *Student's Guide to Bovine Clinics* also goes into more detail than Heidi's, which was a concern, changing something that works. To compensate, different sized type and bolding important information was used. The key words in the shaded box provide a handle on each condition. Bold type allows skimming facts/causes, clinical signs, diagnosis and treatment. More in-depth information is given in light type and small type. Other texts keyed under the condition allow for quick references. John Roberts did many of the cartoons. Those done by me tried to follow his style. The cartoons add life and help page recognition.

In Veterinary school I had trouble with many of the methods and attitudes of some of my professors. Many seemed to expect me to remember everything I had ever been told in classes semesters earlier. I usually didn't! If as a child I had been lectured on the ABCs, tested two weeks later and expected to remember forever, I probably wouldn't be able to use a keyboard today. The key to learning all this information is seeing as many patients as possible and reading as many texts on each condition over and over to supplement veterinary classes. Then go back to the guide and try to organize all the facts in your mind over and over again. Differential diagnoses, the key to diagnosis, are highlighted in a shaded box.

In the senior year many teachers embarrass students with how little they remember. When in a panic, slide around the corner and quickly read through a condition in the guide. Short term memory may allow an intelligent answer to the teacher in front of your peers.

During under class years, this may be the book to keep the forest in focus while dealing with all the trees. Classes such as pathology, clinical pathology, parasitology, virology, bacteriology, neurology, etc. deal with conditions not fully discussed until later in medicine and surgery classes. Read about them in this guide to get an overview of facts, clinical signs, diagnosis and treatment. This should make these conditions less disconnected, thus more meaningful, and easier to learn.

This Guide is incomplete, but with continued work and the help from other seniors and faculty members

it may turn into the key to Bovine Clinics. Please send any ideas, criticisms, praise, corrections or charts to: Sudz Publishing  
1222 S. Hwy. 377.  
P.O. Box 1199  
Pilot Point, Tx 76258  
(940) 686-9208

Most of all, as you go through veterinary school remember the feeling on finding out that you had been accepted to veterinary school and that you would one day be a veterinarian. Veterinary school seems to kill this excitement, don't let it!

Chris Pasquini

**Disclaimer:** the authors do not assume any responsibility for any results obtained from the procedures, treatment, drugs, and dosages used; nor shall the author be held liable for any misinformation or errors that may have been obtained by any persons or organization using this book.

**Acknowledgments:** Susan Pasquini's work makes up the heart of this book, her revisions and corrections make up its complexion. John Robert's illustrations give it personality. Tory Yaphé gave it its index. I would like to thank Lynn Lankes, DaLee Caryl, Jason Steinle and other Oklahoma State University students of the class of '95 for editing. Thanks to Anne Cougar and Nancy Cathey, librarians at OSU. Thanks goes to Dr. Kerstin Thorén-Tolling for the Clinical Pathology Chart. And lastly the Students of Floss University who made my three years in paradise just that.

2

IM 1701; Br B15

## Deworm (Spring calving)

- Cow: After calving; Before pasture
- All stock in Fall
- All stock in Spring
- As enter feedlot

## Deworming program

(no single program fits all area & climate conditions, below is a starting point to greatly reduce Ostertagia problems, including inhibited larvae)

- Spring calving
  - Deworm cows at end of calving season, right before turnout to summer pasture
  - Deworm spring calves by midsummer (ideal [supplement blocks, top dressing])
  - Deworm all stock in late fall (at weaning in beef calves)
    - . Move to clean pasture that day
- Fall calving
  - Deworm cows before overwintering
  - Deworm all stock in Spring, before Summer pasture
- Yearling Spring calves & Fall calves
  - Deworm in late Spring
  - Deworm in Summer if intensively grazed on Summer pasture
- Beef entering feedlot
  - Deworm
- All adult
  - Spring & Fall minimum, coincide w/ management practice

## Anthelmintics

### • Beef cows

- Ivermectin, Valbazen® (albendazole), Synanthic® (oxybendazole) or high-dose Panacur® (fenbendazole) will get inhibited Ostertagia larvae
- TBZ® (thiabendazole), Panacur® (fenbendazole) or Levamisole will get all important GI worms, except inhibited Ostertagia larvae

### • Dairy cows

- Rumatek® (morantel tartrate) or Baymix® (coumaphos) at any time (dry or lactating) because they have no milk withdrawal time, TBZ has 96 hr withdrawal & the rest are not recommended for dairy cows of breeding age

### • Fluke area

- Clorsulon or albendazole

### • Miscellaneous:

- Phenothiazine & hygromycin
- Piperazine: Lungworm Tx, replaced by others because requires 3 day treatment

Anthelmintic	Dose mg/kg	Gut Adult	Lung Larvae	Tape	Flukes Adult	Immature	Comments	Withdrawal time Milk	Meat
<b>Benzimidazoles</b>							<b>Benzimidazoles:</b> Mech: starve worms, Carbamate anthelmintic, Low toxicity		
 <b>Thiabendazole (TBZ®)</b>	66	+	-	-	-	-	• <b>Thiabendazole (Rx 861)</b> - Preparations: 43% oral paste, 2 or 15 g boluses, 3.3% cubes & suspension - 110 mg/kg recommended for severe infections, Tx may be repeated in 2-3 wks	3d	96 hrs
<b>Fenbendazole (Panacur®)</b>	5	+	±	+	+	-	• <b>Fenbendazole (Rx 662)</b> - 2X dose for hypobiotic larvae (very safe 100 X dose) - Preparations: suspension, paste, supplemental block, Premix for 1 days (crumbles, pellets & cubes), Free choice mineral mix over 3-6 ds	3-13d	-
<b>Albendazole (Valbendazole®)</b>	7.5	+	±	+	+	±	• <b>Albendazole</b> - Kills adult flukes & all nematodes, including hypobiotic larvae (Ostertagia) - Oral drench (11%), Not 1st 45 ds of gestation	27d	-
<b>Oxyfenbendazole (Synathic®)</b>							• <b>Oxyfenbendazole (Rx 851)</b> - Preparation: rumen injection, drench suspension, not for breeding age dairy cows	7d	-
<b>Imidazothiazoles</b>							• <b>Levamisole (Rx 643)</b> - Non teratogenic, can use in pregnant cattle; Mech: paralyze worms (cholinergic agonist) - Preparation: SQ injection, oral gel, oral boluses, soluble powder drench, pour-on - Less effective against inhibited larva, Not for dairy cows of breeding age - Narrow margin of safety, toxic signs, injection site reaction so not near slaughter	7d	-
<b>Levamisole (Tramisol®, Levamisol®)</b>	8	+	-	+	-	-			
<b>Tetrahydropyrimidines</b>							• <b>Morantel tartrate (Rx 792)</b> - Nontoxic, safe in young & pregnant animals, can be feed to lactating dairy cows - Preparation: Oral bolus, medicated premix, Mech: paralysis of worms	14 d	0d
<b>Morantel tartrate (Rumatel®)</b>	9.7	+	-	-	-	-			
<b>Avermectin</b>							• <b>Ivermectin (Rx 518)</b> - Hi activity against nematodes & some ectoparasites (warbles, lice, mange mites & ticks), Hi safety - Preparations: SQ injection not IV or IM (1% solution - 1 ml /100 lbs), Pour-ons, or drench - Mech: flaccid paralysis of parasite (Stimulate GABA [inhibitory transmitter]), not for dairy cows - NO effect on trematodes (flukes), cestodes (tapeworms), or protozoa (coccidia) bec. they don't have GABA - Persists in tissue for 2 wks (don't need to move to clean pasture right away & reduces frequency of Tx)	35d	-
 <b>Ivermectin (Ivomec®)</b>	0.2	+	+	+	-	-			
<b>Sulphonamide</b>							• <b>Coumaphos (Rx 178)</b> - Preparation: Premix (mix so 2 mg/kg for consecutive days) repeat at 30 d intervals - Mech: cholinesterase inhibitor, Atropine & 2-PAM antidota	89	0d
<b>Clorsulon (Curatrem®)</b>	7				+	±			
<b>Anticholinesterase</b>							• <b>Clorsulon (Rx 316)</b> - Only flukicide cleared in USA, effective against flukes 8 wks or older - Preparation: oral drench (1-qt containers), can be used w/ other anthelmintics	2d	0d
<b>Caumophos (Baymix®)</b>									

# Vaccinations

4

## All Cattle

### Highly recommended

- IBR (pg 252)
- BVD (pg 253)
- *Leptospira bacterin* (5 serotypes) (pg 257)

## 8 wk-old Calves

- Above (IBR, BVD, Lepto bacterin) +
- PI3 (Parainfluenza) (pg 65)
- Clostridial bacterin (pg 250)

## 6 mo-old Calves

- Above (IBR, BVD [MLV], Lepto bacterin) +
- Bov. resp. syncytial virus (pg 64)
- PI3 (Parainfluenza) (pg 65)
- Brucellosis (heifer replacements only) (pg 122)
- Clostridial bacterin (pg 250)

## Adult Beef Cattle (bulls, cows & replacement heifers)

- Above (IBR, BVD [MLV], Lepto bacterin) +
- Campylobacteriosis bacterin (pg 119)

## Adult Dairy Cows

- Above (IBR, BVD [MLV], Lepto bacterin) +
- No Campylobacteriosis if artificial insemination (AI)

## On Entering Feedlot & Stocker Cattle

- Above (IBR, BVD [MLV], Lepto bacterin) +
- Bov. resp. syncytial virus (pg 64)
- PI3 (Parainfluenza) (pg 65)
- Pasteurella vaccines (pg 255)

## Specific herds &/or in specific geographic areas

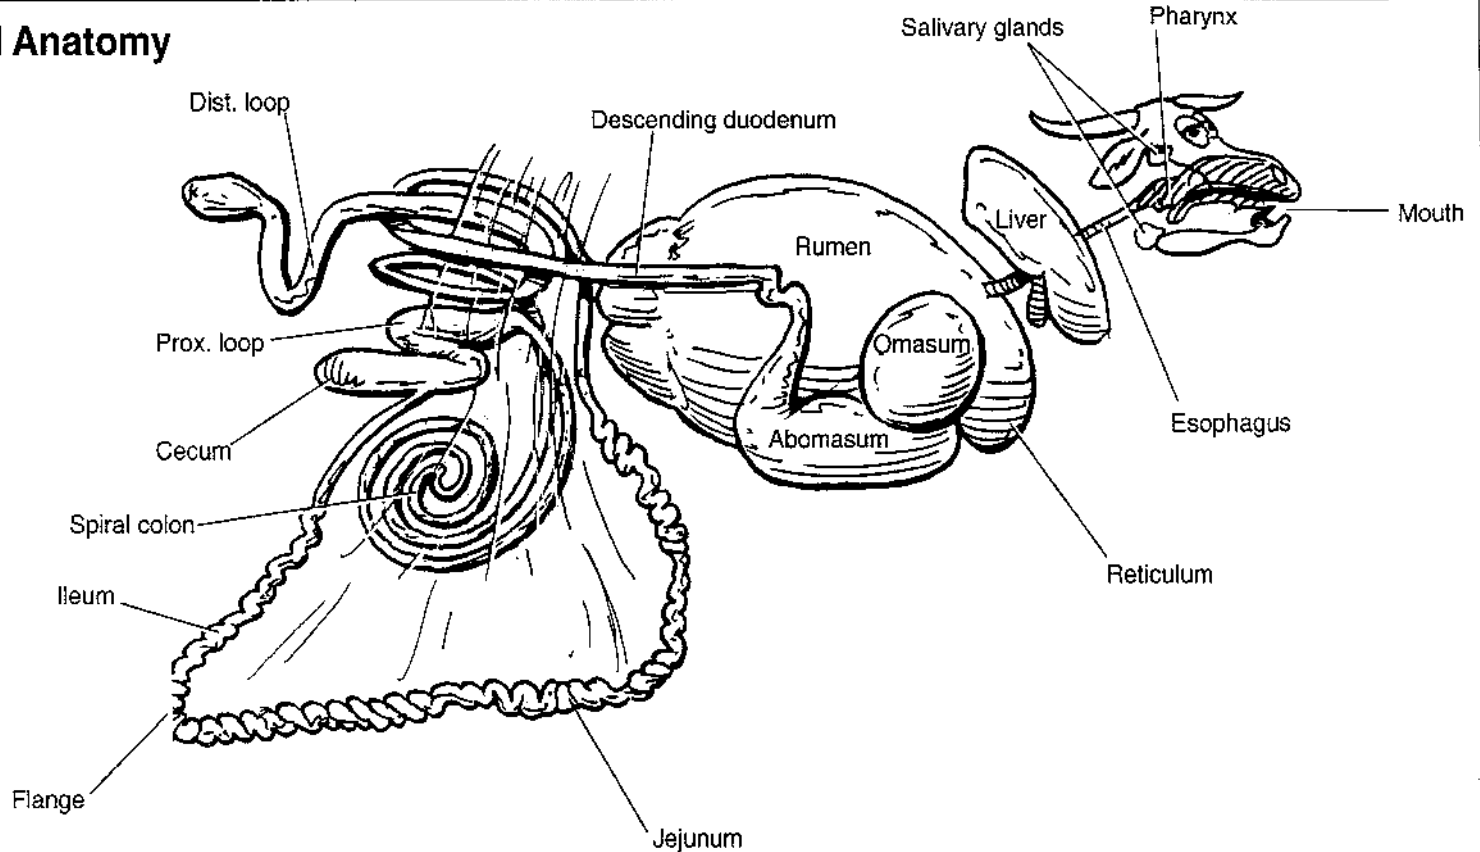

- *Trichomonas fetus*
- Anaplasmosis (inactivated)
- *Clostridium hemolyticum* bacterins
- Anthrax vaccines
- *Clostridium novyi* bacterins
- Rotavirus-coronavirus (inactivated)
- *E. coli* bacterins
- *Leptospirosis hardjo* bacterins
- *Staphylococcus aureus* bacterin-toxoid
- *Moraxella bovis* bacterins (more common in young)
- Campylobacteriosis bacterin
- Malignant edema (Cl. septicum)
- *Hemophilus somnus* bacterin (calves)
- Pasteurella bacterins (not in adults)
- *Moraxella bovis* bacterins (yearling dairy heifer replacements)
- *Hemophilus somnus* bacterin (yearling dairy heifer replacements)
- Blackleg (*Cl. chauvoei*) (196) (yearling dairy heifer replacements)

## Rinderpest, RP "Cattle plague"

Mk 404, C3T 444, 899, C2T 497; IM 820; BM&S 142, Br 543; BR-hb 384; BR 990; Derm 113; Pa 5; Pic 191

**USA FREE**

- Never occurred in N. Amer.
- Rinderpest virus (Paramyxovirus)
- Most severe infec. diz of cattle
- Highly contagious (morbidity 99%)
- Fatal (mortality 25-90%)
- Cattle & water buffalo >> sheep & goats
- 1 of 4 distinct cattle plagues
- Reportable

- Epidemics (plagues)
- Fever, depression, anorexia
- Dry nose
- Oral erosions (similar to VS, FMD)
- Purulent lacrimation
- Severe diarrhea
- Dehydration & emaciation

- CS, report
- Lab confirmation

- Tx unrewarding
- Quarantine
- Slaughter affected animals & exposed ruminants & swine
- Disinfect area

Prognosis (Px):  
• Grave: Death 25-90%

**USA FREE**

Not in USA; Severe; Contagious (99%)

CS: Fever, GI (Necrotic Stomatitis)

Tx: Has never occurred in N. America

Px: Grave - 25-90% Die

DDx:

- Bluetongue (p 10)
- VS (p 11)
- BVD (p 9)
- MCF (p 10)
- Arsenic (p 202)
- Coccidiosis (p 260)
- IBR (p 252)
- GI - diarrhea (p 16)

## Mucosal disease, Chronic BVD, BVD/MD

Bovine viral diarrhea/  
Mucosal disease

Mk 166; IM 806;  
GI 707; DC 230;  
L 115; Pa 5

\*\*\*

- See GEN pg 253
- **Togavirus**
- Cytopathic & noncytopathic biotypes
- Immunosuppressive
- Mucosal diz requires both biotypes to develop
- Transmission:
- Direct or indirect
- Transplacentally
- Incubation: 5-10 day
- 8-24 mo, all ages

1. Inapparent infections
2. Classical BVD: Diarrhea, Oral erosions
3. Respiratory diz
4. **MUCOSAL DIZ (chronic BVD)**
- Total anorexia - cachexic
- Enophthalmos (from loss of fat, not dehydration)
- Oral erosion, nares, teats & vulva
- Ulcers develop whitish-gray to yellow diphtheritic membrane
- Erosive coronary band & interdigital space
- Lameness
- Die w/in 2 months
- Dermatitis (from hyperkeratosis to erosive lesions)

- Presumptive - physical exam & necropsy
- Definitive Dx requires 2-3 weeks virus isolation
- Severe leukopenia
- DDx Rinderpest & FMD

DDx:

- Rinderpest (p 9)
- FMD (p 11)

- BVD/MD - cull
- Persistently infected cows - sold to slaughter

Prognosis (Px): Grave  
- Virtually 100% die,  
low morbidity

May require both non- & cytopathic biotypes

CS: Oral lesions, Cachexia, Lameness, Death

DDx: Rinderpest & FMD

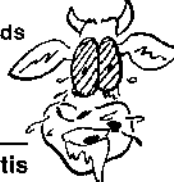

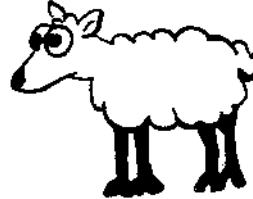

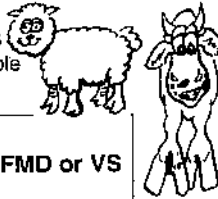

Tx: Cull

**BVD / MD**

## Vesicular stomatitis, VS

Mk 372; CST 447; IM 817; BR-hb 382; BR 976; Br 546; DC 189, 277; Derm 113; GI 707; Pa 5; Pic 52

\*

- Equine, pigs & cattle
- Rhabdovirus, can't penetrate intact mucous membranes
- Abrasions in mouth
- Spread by poor milking hygiene (machine or by hand)
- Cyclic/sporadic every yr & m/b epidemic
- Short incubation
- 6-8 yr-old retired dairy cattle
- Reportable disease due to similarity to FMD

- Identical to FMD**
- Epidemic
  - Ulcerations of mouth, teats & interdigital areas (macules to papules to vesicles to ulcerations)
  - Temp 106° F, then decreases
  - Excess salivation
  - Dysphagia, reluctance to eat, Lose weight
  - Decr. milk production
  - Lameness on feet
  - Recover 2-21 d

- Sequelae
  - M/ not regain milk production
  - M/ block teat canal - mastitis

- CS, Hx (6-8 yrs-old)
- Viral isolation from lesions
- Serology - serum neutralization test - rapid titer formation

### DDx:

- FMD (p 11)
- BVD (single animal) (p 9)
- Rinderpest (single animal) (p 9)
- BPS (single animal) (p 8)
- Bristle grass (p 240)
- IBR (p 252)

### • REPORT to Feds

- Supportive therapy & isolation
- Soft feeds & fresh water & shade
- ABs in severely debilitated - 2" infection
- Teat lesions
  - Milk infected cows last
  - Ointments to protect from flies, etc.

- Px: Good, Death uncommon (high morbidity, low mortality)
- Recovery 2-21 ds
  - M/ not regain milk production

### Identical to FMD, 6-8 yr-olds

CS: Identical to FMD: Ulcers - Mouth, Teats, Digits

Dx: Viral isolation, Serology

Tx: Reportable

### Prevention & Control

- Notify Federal agents, they take over
- Disinfect the environment - 10% formalin or iodides
- Two vaccines, rarely used, except where recurring epidemics on same farm yearly
- Adm. under fed. agent supervision. Vaccine interferes w/ serological testing

## Foot-&-Mouth disease (FMD), Aphthous fever

Mk 398; CST 437; C2T 490; IM 819; BM&S 153; Br 537; BR-hb 378; BR 965; Derm 111; GI 707; L 113; Pa 5; Pic 189

USA Free

- USA FMD free - Reportable
- Economically devastating
- Picornavirus
  - Attaches to epithelium of GI tract
- Transm. - aerosol, Highly communicable
- Vectors - human, milk, carcass
- Cattle & swine >> sheep & goats

- Identical to vesicular stomatitis (see above)
  - Blisters & vesicles on mouth, teats & feet
  - Ulcers, reluctance to move
- Rapid spread
- Mastitis
- Weight loss
- ♀ milk production
- Freq. abortions

### DDx:

- Vesicular stomatitis (p 11)
- BVD (single animal) (p 9)
- Rinderpest (single animal) (p 9)
- BPS (single animal) (p 8)
- Bristle grass (p 240)
- IBR (p 252)

- Reportable
- Viral isolation from lesions
- Serology - serum neutralization test - rapid titer formation
- ELISA, CF, FA

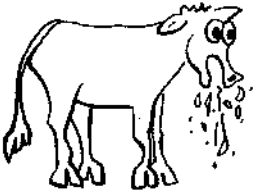

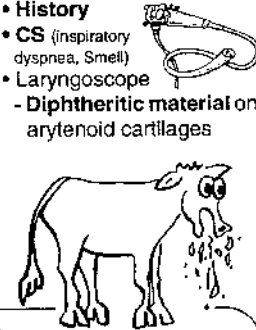

- Prevention
- Vaccines used in countries where enzootic, not USA

USA - FMD free, Economically devastating  
CS: Like VS, Wt. loss, Abortions, Mastitis  
Dx & Tx: Report, Quarantine, Slaughter

**Actinobacillosis**  
**"Wooden Tongue"**

Mk 317; CST 534; C2T 606;  
 IM 794; BR-hb 334; BR 852;  
 Br 627; BM&S 257; DC 184;  
 GI 706; N-L 177; Pa 8; Pic 57  
 \*\*\*

- *Actinobacillus lignieresii*
- Gram neg. saprophyte
- Inhabitant of mouth
- Enters through abrasions
- Coarse feed, straw or fibrous feed
- Cattle, occasionally sheep
- Normally sporadic, m/b herd problem - coarse feed

**Abrasions/Coarse feeds**

**CS: Soft tissue diz**

**Dx: Sulfur granules, Gr - rod**

**Tx: IV Na iodine, Px: Good**

**Actinomyces, "Lumpy jaw"**

Mk 318; CST 536; C2T 607;  
 IM 796; BR-hb 333; BR 851;  
 BM&S 255; Br 629; DC 186;  
 Derm 148; GI 706; Pa 8; Pic 58  
 \*\*\*

- *Actinomyces bovis* (bacteria)
- Gram +, branching filamentous
- Normal inhabitant of mouth
- Chronic bacterial diz of cattle > sheep & goats
- Invades abrasions into bone
- Teeth eruptions, coarse feed
- Osteomyelitis of jaw
- Mandible > maxilla
- Non-painful swelling
- Can rupture & drain fetid fluid
- Contaminates environment

**Osteomyelitis of jaw**

**CS: Bone & soft tissue diz**

**Dx: Culture, Gr + filament, Rads**

**Tx: Cull**

- Soft tissue diz
- Stomatitis
- Hard & swollen tongue (m/ protrude from the mouth)
- Painful
- Dropping food, prehension problems, m/not be able to move to back of pharynx
- Granuloma formation on other parts of body by licking broken skin
- Stridor or noise (respiratory)
- Lymphadenitis of head & neck
- Dehydration, weight loss
- Chronically see tongue scarred, smaller & less motile

**Combiotic®** (penicillin/streptomycin combo) commonly misused in past; now outlawed

**DDx:**

- Dental diz (p 7)
- Oral foreign bodies
- Pharyngeal trauma (p 17)
- Dizs causing oral pain, vesicular dizs (p 8-12)
- Granulomas
- Tumors
- Polyps
- Cysts

- Hard, immovable, bony mass of mandible
- Later fistulous tracts
- Lymphadenitis
- Swelling of the pharynx
- Bloat
- Excess salivation
- Dysphagia
- Quidding (dropping feed)
- Early fever, resolves
- Occasional granulomas in other tissues

- History (trauma)
- Palpation
- Culturing the exudate
- Rads
- Check for pathological fractures or tooth involvement
- Mandible & maxilla, radiolucent areas, abnognal remodelling

**DDx:**

- Mimics stomatitis (p 8)
- Always think RABIES (p 144)
- Tooth root abscesses (p 7)
- Tumors
- Osteomyelitis (other org.)
- Fractures (p 7)

- Tx during acute phase - successful
- Bland diet, soft
- IV sodium iodide, repeat in 1 wk, then 3 wks later, watch for signs of iodide toxicity (coughing, tearing, dandruff)
- Penicillin or tetracycline

**Prognosis:**

- Good
- Once chronic - Poor

**Prevention: avoid traumatic feed (stems, grass awns)**

- Cull (normally)
- Iodides
- Penicillin & streptomycin
- Curette out bone, remove affected teeth (careful or fracture)

**Prognosis (Px):**

- Poor
- Generally animals do not recover

**Prevention: avoid traumatic feed (stems, grass awns)**

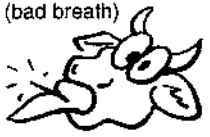

**Iodides do not cause abortions, but questioned by some**

## Esophageal obstruction, Choke

Mk 173; C3T 712; C2T 714; IM 822; BR-hb 71; BR 180; BM&S 659; Br 631; GI 707; S-J 504; S-O 430; VC/S 360; Pa 20; Pic 61

\*\*\*

### • Greedy eating

- History - eating beets, apples, other large, solid objects

• Dry ingesta - poor quality roughage; if not enough water, dry ingesta forms into a ball

• Treated *Hypoderma lineatum* dead larvae, severe reaction

• Complete or partial obstruction

### • Acute

• Bloat, possibly rapidly fatal

• Difficult swallowing (retching)

• Salivation

• Feed stuff in both nostrils

• Acute coughs

• Rapid, shallow breathing (head & neck extended, may swing from side to side)

• Cellulitis around obstruction (painful, hot swelling)

• Chewing movements

• Protrusion of tongue

• Anxious, go off feed

### Complications:

• Aspiration pneumonia

• Esophageal rupture

• Esophageal stricture

• History (beets), CS

• Inability to pass gastric tube

• Palpate cervical esophagus

• Endoscope - see if sharp object

• **THINK RABIES!** - animal that can't swallow

• Relieve bloat first (acute) - trocar rumen

• Pass tube gently to localize choke

• Remove obstruction (see box)

• Mild, careful tranquilization (m/v swallow when spasm relieved), low dose Xylazine

• ABs (antibiotics)

• NSAIDs

• Soft food (beet pulp)

Prognosis: Good if no damage or stricture

### DDx

• Rabies (can't swallow) (p 144)

• Botulism (p 145)

• Tetanus (p 145)

### Remove object

• Pharyngeal inlet - massage out mouth, or #9 wire loop through mouth speculum, past object, pull out mouth - may use tranquilizer or muscle relaxer (succinyl choline)

• Thoracic - push into rumen w/ stomach tube (be sure its not sharp)

• Near diaphragm - rumenotomy, then pass a tube retrograde

• Feed ball: lavage gently with water to break it up

• Esophagostomy last resort, problem w/ stricture & poor healing, give

ABs, let heal by 2<sup>nd</sup> intention, 2nd incision distally to feed by stomach tube

### Apples & turnips

CS: Acute bloat

Dx: Can't pass tube

Tx: Relieve bloat

## Esophageal disorders

C2T 7145; IM 823; Br 630; BR-hb 71; BR 179; BM&S 661; GI 707; S-J 503; S-O 428; S-N 65; VC/S 268; Pa 18; Pic 61

\*\*

Esophageal trauma/rupture: Uncommon • Cause: choke, stomach tube or probang. If suspect rupture - immediate slaughter

Esophageal stenosis • Causes: healed trauma, persistent rt. aortic arch, swollen mediastinal lymph nodes, tuberculosis, lymphosarcoma, pneumonia • CS: bloat

Dead cattle grubs (*H. lineatum*) from OPs, see Skin pg 182

Esophageal dilation (megaesophagus) & hiatal hernia: Rare, assoc. w/ pharyngeal trauma, inflam. of vagus nerve & hiatal hernia (diaphragmatic hernia) & persistent right

aortic arch • CS: regurgitation or vomiting after eating, bloat

• Dx: pass stomach tube to R/O choke, contrast radiographs • Sx: exploration • Rabies must always be R/O in esophageal dysfunction

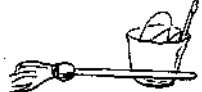

• Tx: fluid by stomach tube 1-2 wks m/b, Sx - hiatal hernia in valuable animal

Esophageal diverticula: rare outpocketing

## Treatment of neonatal diarrhea

**Correct dehydration & acidosis** (common causes of death)

- **Depressed calves that don't suckle** (no milk)
  - IV fluids (saline based) + bicarbonate (see below)
  - Hypoglycemia - add 5% glucose to IV fluids
  - Should be up & suckling after 24 hours of Tx
- **Nursing calves & mildly affected calves** (milk in diet)
  - High energy oral electrolytes, or tube feeding
  - Milk + nonbicarbonate electrolytes
  - Multiple feedings 4-6/d better than 2 w/d - better absorption
- **Colostrum/failure of passive transfer** (see box)
  - Give colostrum if less than 18 hours of age
  - > 36 hours can't use colostrum, must give plasma

**Fluids & maintenance** 50-100 ml/d & anticipate fluid loss (up to 4 L/day)

- Fluid needed - degree of dehydration (gauged by degree eyeball is sunken & skin tents)
- BW (kg) x % dehydration = amt. given (liters)**  
(e.g., 50 kg x 10% = 5 L needed to rehydrate, given over 4-6 hours)
- Isotonic fluids (Lactated Ringer's)

**BW x % dehydration = liters**

**Acidosis - Bicarbonate requirement**

- Alert, suckling calves do not need bicarbonate
- Comatose calves require more than depressed calves
- Dehydration has no correlation w/ acidosis
- Ideally give over a 24 hour period, but 4 to 8 hours OK
- Not necessary to completely correct acidosis, get close to normal
- After 24 hrs. calf should be up suckling; if still depressed sign of incorrect metabolic problems or toxemia

- Add bicarbonate in isotonic solutions (166 mmol/L)
  - Homemade: 13 gm Na bicarbonate (baking soda) in 1 L of water
- **How much bicarb. w/ no lab test available**
  1. Give bicarbonate empirically; or
  2. Rehydrate 1st & if not suckling in 12 hrs, consider giving bicarb
- 3. **Empirical starting point**
  - Young calves (< 8 ds) 3L of 1.3% saline + 1 L of 1.3% Na bicarb
  - Older calves (> 8 ds) 2 L of saline + 2 to 3 L of 1.3% Na bicarb
- **Blood gas measurement**
  - mmol Bicarbonate = Body wt (kg) x Base deficit (mmol/L) x 0.5

**Hypoglycemia** - most don't have, add "IF" in poor body condition

- Add glucose to IV fluids, 5% concentration (1-2% dextrose/liter) to Lactated Ringer's (4 mEq/l of K)

**Antimicrobial - frequently used**

- *E. coli* & *Salmonella* only org. that respond
- Cult./sens. important (resistance high in both; improper ABs select for resistant strains)
- Viral & protozoa not affected directly, but 2<sup>o</sup> infection, so ABs
- Prolonged oral ABs m/ cause diarrhea, so don't use on calves older than 5 d, unless evidence of *Salmonella* or giardiasis
- Oral ABs effective for *E. coli*, 3 days usually sufficient

**Milk withdrawal? (take off all milk?)** - can reduce severity of diarrhea & depression (milk osmotically pulls water into GI)

- ± 1-3 day withdrawal in depressed calves that don't suckle
- >3 d no benefit even if diarrhea persists, so reintroduce to milk
- Do not withdraw from alert calves that suckle
- Lactase is lost during withdrawal so reintroduce milk slowly
- **Reintroduce milk when diarrhea is resolved**
  - To restart induction of lactase (inducing enzyme)
  - Day 1-2 - 2.5 parts milk + 2.5 parts electrolytes (QID)

Day 3-4 (cut in half elec.) 2.5 parts milk, 1.25 parts electrolytes  
Day 5-6 (cut in half elec.) so 2.5 parts milk, 0.625 parts electrolytes  
Need 10% of body weight in kg per day

**Energy in chronically scouring suckling calf** (50

- kg/calf requires 2000 kcal & 3500 kcal for weight gain of 0.5 kg/d)
- 3-6 L of whole cow's milk/day
- If no milk being ingested give:
  - High energy oral electrolyte (Lifeguard HE@, Biolyte 50% energy needed if BID 4 L total, 75% if TID 6 L) (Lifeguard HE@ only 25%)

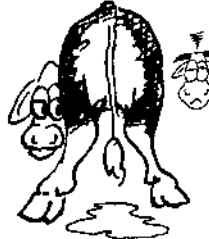

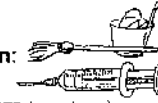

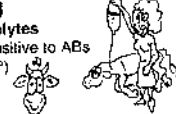

**Catheterization of calf's jugular vein**

- Clip & prepare skin
- Nick skin w/ #15 scalpel blade (skin thick in dehydrated calves)
- If can't find jugular, suspend calf upside-down so blood will pool
- Lay animal flat after catheter placed
- Warm fluids, especially in hypothermic calves

## Neonatal Diarrhea

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>E. coli</b> <b>Colibacillosis.</b> <b>Enteric E. coli,</b> <b>Enterotoxigenic colibacillosis</b> Mk 181, C3T 105, C1T 118; C2T 105; IM 396; BR-hb 298; BR 707; Br 167; DC 156; GI 755; Pa 56; Pic 22 ***	<ul style="list-style-type: none"> <li>• See Gen pg 258 All systems, esp GI</li> <li>• <b>Escherichia coli</b> <ul style="list-style-type: none"> <li>- Enterotoxigenic K99</li> <li>- Normal GI flora, in GI soon after birth</li> <li>- Adhere &amp; colonize gut wall (pili -K99, F5)</li> </ul> </li> <li>• <b>Enterotoxins/septicemia</b> - hypersecretions of electrolytes, fluids, bicarbonate, water (dehydration, electrolyte disturbances &amp; hypoglycemia)               <ul style="list-style-type: none"> <li>- May enter through umbilicus, or orally</li> </ul> </li> <li>• &lt; 4 day-old (occasionally older)</li> <li>• <b>FPT (failure of passive transfer)</b></li> <li>• <b>Septicemia</b> - bacteria &amp; their toxins in blood stream, fever not consistent feature of septicemia in neonates</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Found dead w/ no diarrhea</b></li> <li>• <b>Profuse watery diarrhea, white to yellow</b></li> <li>• <b>Dehydration</b></li> <li>• <b>Acidosis</b></li> <li>• <b>Weakness</b></li> <li>• <b>Death in 6-12 hours (1-4 days)</b></li> <li>• Milder forms can't be differentiated from other causes</li> </ul>	<ul style="list-style-type: none"> <li>• <b>History (&lt; 4 days), CS</b></li> <li>• <b>Culture</b> feces, looking for K99 pili by indirect immunofluorescence of smears               <ul style="list-style-type: none"> <li>- In huge outbreak, sacrifice calf to Dx</li> <li>- 1<sup>st</sup> place - ileum &amp; jejunum</li> </ul> </li> <li>• More than 1 organism m/b causing diarrhea</li> <li>• <b>Lab:</b> <ul style="list-style-type: none"> <li>- Total volume K<sup>-</sup> deficient</li> <li>- Metabolic acidosis</li> <li>- Low bicarbonate</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Aggressive Tx               <ul style="list-style-type: none"> <li>- Isolate</li> <li>- <b>Fluid &amp; electrolytes</b> to restore hydration &amp; vigor</li> <li>- <b>Broad spectrum ABs (Naxcel®)</b></li> </ul> </li> </ul>

## Corona virus

Mk 161; C3T 106; IM 399; Br 164; DC 167; GI 763; Pa 53

\*\*\*

**Worse than rota  
Malabsorption  
Villus & crypts**

- Transm.- Fecal/oral route & air
- **4-30 days**, IP longer than rotavirus
- **Attacks small & large intestine**
- **Malabsorptive**, maldigestive diarrhea
  - Milk in large intestine = diarrhea
- **More virulent than rota**, bacteria attacks both tips & crypts of villi

- **Diarrhea**
- Nonspecific, similar to rotavirus
- $\pm$  Mucus present in diarrhea (due to large intestinal involvement)
- $\pm$  Pneumonia

- **Difficult**
- FA
- ELISA
- Elect. microscope
- **Postmortem**
  - No gross findings, except fluid-filled intestine
  - Histo. - more severe villus blunting & fusion than rota

**DDx:**  
• See *E. coli*

- Same as rotavirus
- Fluid & electrolytes
- Not directly sensitive to ABs. m/ help (2<sup>o</sup>)

**Control:**

- Same as rotavirus

• "**Calf-Guard@**" vaccine for coronavirus, doesn't provide good antibodies

## Enterotoxemia, *Clostridium perfringens*, Hemorrhagic enteritis

\*\*\*

- See Gen pg 250
- Acute noncontagious diz
- Effects the healthiest, fastest growing calves
- Easily & cheaply prevented
- 2 wk-olds
- *Clostridium perfringens* type C

- **Fatal hemorrhagic enteritis**
- **Sudden death**
- Weakness
- Prostration
- $\pm$  Colic
- $\pm$  Nervous derangement
- $\pm$  Terminal diarrhea

- **History, CS**
- **Postmortem:**
  - Hemorrhagic enteritis - small intestine
  - Mouse inoculation

**DDx:**  
• See *E. coli*

- **Tx usually ineffective if CS**
- Hyperimmune serum
- ABs PO & systemic (Extralabel dosage of penicillin or tetracycline)
- Outbreaks from unvaccinated dam
  - Antiserum immediately after birth
- Isolate
- **Fluids** to restore hydration & vigor

**Prognosis: Guarded**

**Prevention:**

- **Vaccination** of dam 2x before parturition; annual booster helps prevent disease
- Hygiene & Colostrum

**Healthiest calves**

**CS: Fatal hemorrhagic enteritis**

**Dx: PM • Tx: Serum, fluids, ABs**

**Prevention: Vaccinate dam**

## Cryptosporidia

Mk 108, 181; C3T 107; IM 400; BR-hb 458; BR 1194; Br 170; DC 168, 183; GI 765; Pa 45; Pic 21

\*\*\*

**Small protozoa  
Sucrose flotation**

- *Cryptosporidium* spp, Protozoa
- **1-4 weeks**
- Individual calf problem
- Fecal/oral route
  - Oocytes immediately infective
- **Malabsorptive**
  - Lower small & large intestine
  - Villus atrophy & fusion
- Auto infect. - relapses & protracted infect.
- Low mortality
- Winter more prevalent
- Affects multiple species
  - mice, man, lambs & pigs

- **Diarrhea**, soft foamy to watery, m/ contain milk, blood, mucus & bile
- Tenesmus
- Dehydration
- $\pm$  **Mhronic diarrhea & cachexia** (auto infection)

**DDx:**  
• See *E. coli*

**PH**

**Public health: man**

- **Pathological oocysts in feces** (m/ require multiple samples)
- Fecal flotation w/ Sheather's SOL. (sucrose)
  - Stain w/ Ziehl-Neelsen (turns organism red)
  - **Small & easily missed**
- **PM: emaciation**

**Giardia:** newly recognized; nonresponsive, chronic, pesty diarrhea, wt. loss.  
• Dx: Lugol's stained smear  
• Tx: Dimetridazole (50 mg/kg 5 d)

- **Supportive Tx**
  - Protracted fluids, elec., acid base
  - Milk - to fight emaciation

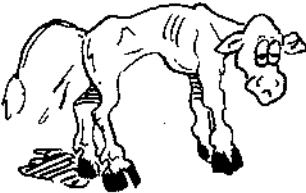

**Prognosis: Guarded**

**Control:**

- **Sanitation**
  - Bleach, 15% formalin
- **No vaccine**

## Diarrhea

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Neonatal salmonellosis</b></p> <p>Mk 181; C3T 108; C2T 578; IM 894, 398; Br 183; BR-hb 302; BR 370; BM&amp;S 223; DC 169; GI 769; L 123; Pa 72; Pic 23</p> <p>***</p> 	<ul style="list-style-type: none"> <li>• See GEN pg 259</li> <li>• #2 economic GI bact (&gt; \$50 mil/yr)</li> <li>• &gt; 2000 serotypes</li> <li>• <i>S. dublin</i>, host specific to cattle, therefore long carriers, Western USA</li> <li>• <i>S. typhimurium</i>, <i>S. montevideo</i>, <i>S. newport</i>, &amp; <i>S. anatum</i> Eastern USA</li> <li>• Invasive organism           <ul style="list-style-type: none"> <li>- Attach to mucous membranes</li> <li>- Destroy cells &amp; pass through GI wall</li> <li>- Move to regional lnn (Peyer's patches &amp; mesenteric lnn)</li> <li>- Live in cells, protected from ABs &amp; disseminate throughout body</li> </ul> </li> <li>• Endotoxins through damaged mucous membr.</li> <li>• Acute protein losing enteropathy</li> <li>• Calves 1-2 months (range 1 wk-6 months, peak 6 weeks) (bacteremia)</li> <li>• Transmission via fecal/oral route           <ul style="list-style-type: none"> <li>- Contaminated animal by-product, feeds, milk</li> <li>- Birds, rodents &amp; cats</li> <li>- Stress m/ cause recrudescence &amp; shedding in feces &amp; milk</li> <li>- IP: 1-4 ds or recrudescence from carrier state</li> </ul> </li> <li>• Predisposition:           <ul style="list-style-type: none"> <li>- Crowded conditions/stress/hygiene</li> <li>- High protein diet</li> <li>- FPT (failure of passive transfer)</li> <li>- Newly purchased calves</li> </ul> </li> </ul> 	<ul style="list-style-type: none"> <li>• Enteric           <ul style="list-style-type: none"> <li>- Initial fever</li> <li>- Intractable diarrhea, brownish, watery to mucoid w/ fibrin &amp; blood, "septic tank odor" (protein)</li> <li>- Extreme weakness</li> <li>- Dehydration</li> <li>- Terminal septicemia</li> </ul> </li> <li>• Enterotoxemia/septicemia           <ul style="list-style-type: none"> <li>- Fever, anorexia, depression</li> <li>- Meningitis</li> <li>- Endotoxic shock</li> <li>- Polyarthrits</li> <li>- Pneumonia (dyspnea)</li> </ul> </li> <li>• Sudden death (12 - 24 hours circulatory collapse) w/ or w/o diarrhea</li> </ul>   <p><b>PH</b></p> <p>PH: Infects man</p> 	<ul style="list-style-type: none"> <li>• Difficult</li> <li>• PM culture of organism from feces, blood or tissue: <b>Definitive Dx</b></li> <li>• Lab m/ or m/not be able to isolate</li> <li>• Culture - need lots of feces           <ul style="list-style-type: none"> <li>- Not easy to grow</li> <li>- Rule: 5 neative cultures, not economically feasible in cattle</li> </ul> </li> <li>• Postmortem(PM):           <ul style="list-style-type: none"> <li>- Emaciated</li> <li>- Pseudodiphtheritic membrane lining dist. small bowel &amp; large bowel</li> <li>- Isolation from mesenteric lymph node, lung &amp; colon</li> </ul> </li> <li><b>DDx from others</b> <ul style="list-style-type: none"> <li>• Higher death rate if not treated</li> <li>• Dehydrated more quickly</li> <li>• Feces more fetid due to protein loss</li> <li>• Fibrinous casts: blood &amp;/ or mucous shreds</li> <li>• Abomasum to colon m/b infected</li> </ul> </li> </ul> 	<ul style="list-style-type: none"> <li>• Isolate sick (noncontact pens)</li> <li>• Antibiotics controversial           <ul style="list-style-type: none"> <li>- Clinically ill calves (oral &amp; systemic)</li> <li>- Culture &amp; sensitivity (resistance to many)</li> <li>- Oral ABs rapidly become ineffective against enteric dz</li> <li>- Systemic ABs prolong recovery &amp; carrier state</li> <li>- Trimethoprim/sulfate inexpensive</li> <li>- Resistant to pen, strap, erythromycin &amp; tylosin</li> </ul> </li> <li>• Valuable septicemic animals           <ul style="list-style-type: none"> <li>- IV Banamine®</li> <li>- Intensive IV &amp; oral fluids</li> <li>- Freq. feedings of milk (emaciation)</li> </ul> </li> <li>• Bacterin - problems w/ adverse reactions &amp; lack of efficacy</li> </ul>    <p><b>Prognosis: Poor, deaths m/ approach 100% in calves</b></p>  <p><b>Colostrum</b></p>  <p><b>Control:</b></p> <ul style="list-style-type: none"> <li>• Difficult bec. of carriers</li> <li>• #1 adequate colostrum intake</li> <li>• Environmental hygiene, constantly clean &amp; disinfect betw. calving (carriers shedding) One-Stroke®, Environ (difficult to eliminate)</li> <li>• Culture animal by-product feeds (40% contaminated in USA)</li> </ul> <p><b>Controlling <i>S. dublin</i> (chronic carriers)</b></p> <ul style="list-style-type: none"> <li>• ID carriers &amp; calves (multiple fecal &amp; milk cultures)</li> <li>• Cull all positive animals</li> </ul>

## Coccidiosis

(Eimeria)

\*\*\*

• See GEN pg 260

• All ages

- Calves > 21 days (life cycle)

- Young & stressed animals

- Transient partial immunity

• *Eimeria bovis*, *E. zuernii*

• 5th most important dz of cattle

• Life cycle (see Gen)

• Pathogenesis

- Destruction of intestinal epithelium

*Eimeria* - #5 - Intest. epith. destruction

CS: Hemorrhagic diarrhea

Tx: Difficult, Amprolium, Support

Prevention: Hygiene, Monensin

• Mild cases

- Diarrhea

- Listless & anorexic for a few days

• Severe

- Hemorrhagic diarrhea (mucus & sloughed Intestine)

- Fresh, unclotted blood from anus

- Rough hair coat

- Tenesmus m/b protrusion of anus

- Myiasis (on soiled hindquarters)

- Emaciation, dehydration & weak

- Die or slow recovery

• Nervous coccidiosis

(See Nerv pg 150)

• Demonstrate parasite in clinically sick animals

- Just coccidia not diagnostic (some apathogenic)

- Oocysts m/ not be in feces in some clinical infections

• Smears of hemorrhagic stool

• Flotation (Sheather's sugar sol.)

• Sporulate in potassium dichromate solution for 1-14 days

• Postmortem: micro exam of scrapings or sections of intestine

• Anticoccidial drugs

- Amprolium (TOC)

- Sulfonamides only partially effective

- Nitrofurazone (not approved in USA)

• Supportive (Fluids, Isolate)

• Treat exposed nonclinical calves

Prevention:

• Hygiene

• Coccidiostats in feed

(Monensin, Lasalocid,

Amprolium, Decox,

Sulfas)

## Ostertagiasis, Parasitism - diarrhea

\*\*\*

• See GI pg 55; *Ostertagia ostertagi* • #1 nematode of cattle, Type I & Type II ostertagiasis - type II overwinters (hypobiosis) in abomasal gastric glands

• CS: Type I - Anorexia, Poor growth, Diarrhea • Type II ostertagiasis (emergence of arrested larvae) Hypoproteinemia, Diarrhea, Anemia, Fever

• Dx: Hx, CS, Egg counts misleading • PM: "Moroccan leather" - pathognomonic

• Tx: Anthelmintics: Adult ostertagia, Give before hypobiosis, Ivermectin, Hi dose of fenbendazole, albendazole

• Px: Type I - good • Type II - damaged mucosa, unlikely to recover

## Salmonellosis, adult

Mk 184; CST 108, 562; C2T 576; IM 894; Br 183, 657; BR-hb 302; BR 370; JDC 193; Pa 72; Pic 23

\*\*\*

• Most common cause of adult diarrhea

(see GEN pg 259)

• *Salmonella typhimurium* (see DDx p 279)

• *S. dublin* (most specific to cattle - longer carrier)

- Occurs throughout USA, IP: 1-4 ds

• Stress (intensive management, crowding), parturition

• Transmission:

- Fecal/oral

- Contaminated high protein diets (fish meal, feather meal)

- Milk

• Penetrates gut wall to mesenteric lymph nodes

*S. typhimurium*  
#1 diarrhea  
Hi protein feed  
Trimeth/Sulfa

• Acute

- Fever

- Severe diarrhea (distinctive smell)

- Mucoid - watery w/ fibrin & blood

• Chronic

- Persistent diarrhea

- Unthriftiness

• Endotoxins cause

- Anorexia, depression

- Shock

• Abortion

• Feedlot (anytime), most common

soon after calves arrive

• Fever & diarrhea

• Defn. Dx: PM cultures of organisms from feces, blood or tissue

• Lab: No consistent values

- Leukopenia often

- Metabolic acidosis

DDx (See pg 279):

• BVD

• Jehne's dz (p 23)

• Coccidiosis (p 260)

• Parasitism (p 54)

• Poisons (e.g., arsenic)

• Winter dysentery (p 23)

• Feed indigestion (p 25)

• ABs - C&S (Naxcel®)

• IV fluids & electrolytes

• Isolate

• Cull chronic carriers

Px: Guarded, most

become chronic carriers,

- 75% die w/o Tx

Prevent (or minimize)

• Isolation

• Cull carriers

• Group culture, then ID individuals, cull

• Control bird & rodent pop. & their access to feed

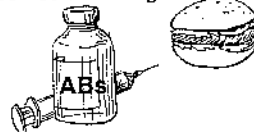

• By-product feeds - scanned for Salmonella, sealed containers

• Proper disposal of carcasses

# Adult Diarrhea

# DIGESTIVE SYSTEM

## Winter dysentery, Winter scours

Mk 226; IM 892; BM&S 679; Br 659; BR-hb 396; BR 1026; DC 213; GI 778; Pa 69; Pic 53

\*\*\*

- Acute infection, endemic diz of stabled cattle
- All ages (calves & yearlings least susceptible)
- Winter months
- Herd outbreaks
- Unknown agent probably infect. agent bec. of spreading, m/b coronavirus
- Incubation period 3-5 days
- Sudden onset (1 w/ diarrhea, then rest of herd)

- Explosive watery diarrhea w/ clotted blood (dark feces)
  - Acute outbreak & spread, Resolves in short time (2 ds)
  - Some prolonged (unknown cause)
- Anorexic, dull
- Milk decr. (1st sign often noticed)
- Cough - 30 to 50%
- Severe cases
  - Colic (lay down, get up, appear restless, anxious, kick at belly, tread w/ hindlimbs, stand w/ elbows abducted)
  - Dehydrated (short duration so usually not a problem)

- None, self limiting
- Palliative: feed, water & salt
- ABS not needed, immune for life or at least less severe diz
- No vaccine

Px: Good: low mortality - Immune for life

### Prevention:

- Watch animals as come into barn for winter
- Isolate new cows for 2 weeks
- Acute diarrhea cases - separated from herd until recover, IP short so likely rest exposed
- Hygiene of handlers

## Herd outbreaks, Stabled cattle - Winter, Cause?

CS: Short herd outbreak, Diarrhea • Dx: Hx, CS

Tx: Self limiting

## Johne's disease, Paratuberculosis

Mk 399; C3T 533; C2T 601; IM 899; BR-hb 330; BR 841; Br 664; DC 208; GI 783, 816; Pa 62; Pic 53

\*\*\*

- *Mycobacterium paratuberculosis*
  - Acid fast bact. Survives in soil for one year
- Adult onset 2-5 years
- Subclinical carriers
- Granulomatous enteritis (multiplies in cells of ileum, cecum & associated lymph nodes)
  - Malabsorption - protein
  - Protein losing enteropathy
- Transmission:
  - Fecal/oral route (so dairy >> beef, due to concentration of animals)
  - Intrauterine
  - Milk
  - Usually introduced into herd by a subclinical carrier

- Most carriers w/ no CS
  - ± Poor fertility, mastitis, ↓ milk or other 2° dzs
- Chronic/intermittent diarrhea (homogenous w/o blood, fibrin or bad odor)
  - Weight loss
  - Muscle wasting
  - Unthrifty (rough hair coat, alopecia & dry skin)
- Advanced stages
  - Dehydration
  - Anorexia (cachexia & emaciation)
  - Debilitated & die
  - Course of wks to 6 mos

- History, CS
- No reliable diagnostic test for preclinical cases
- Definitive Dx:
  - Isolate org. from feces or PM
  - Fecal culture takes up to 12 wk
- Lab: Hypoproteinemia
- Postmortem:
  - Granulomatous enteritis (whole GI, most commonly dist ileum)

### DDx:

- Chronic diarrhea
  - Parasitism (p 54)
  - Chronic BVD (p 9)
  - Salmonellosis (p 259)
  - Renal amyloidosis (p 95)
  - CHF (p 76)
  - Intest. neoplasia (p 51)
  - Fat necrosis (p 50)
  - Chronic peritonitis (p 53)
- Weight loss
  - Malnutrition
  - Starvation (p 189)
  - Cobalt or Cu defc (p 87)

### CONTROL & PREVENTION

#### Stop introduction into free herd

- Replacements from certified free herds
- Semen from Johne's-free bulls

#### Infected herds - test & cull

- Adults w/ chronic diarrhea, isolate, test & cull if positive
- Fecal culture all adults at 6 mo intervals, cull positives
- Calves of infected cows, cull
- Separate calves at birth from cows & feces
- Colostrum from negative cows or pasteurized
- Vaccinations of value, but interfere w/ TB tests, need state authorization
  - Vaccinate animals that are sold, need a health certificate saying from a Johne's infected herd

## M. paratuberculosis, Adults, Chronic malabs./hypoprot.

CS: Asymptomatic, Chronic wasting & diarrhea, Fatal

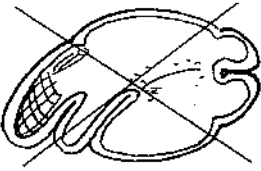

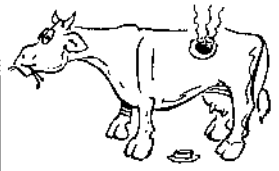

Dx: Isolate org. (12 wks) • PM: granulomatous enteritis

Tx: None - Die if CS; Certify free, Test & Cull

## Grain Overload

## DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Amyloidosis</b> ★	<ul style="list-style-type: none"> <li>• See pg 94, Rare, Urinary system; Twisted sheets of protein that accumulate due to chronic inflam., Deposited in glomeruli &amp; GI (malabsorption)</li> <li>• CS: Intractable diarrhea, ventral edema, Weight loss, oral lesions</li> <li>• Dx: CS, Hx, Hypoproteinemia, PM: kidney</li> <li>• Tx: Salvage • Px: Grave</li> </ul>

<b>Prolonged Hi-conc. feeds (finishing), Little roughage</b> CS: Not clinically ill, Economic loss (No wt. gain) Tx: Nothing • Prevention: Roughage 10% of dry matter				
<b>Rumen impaction</b> C9T 710; BR 259 ★★	<ul style="list-style-type: none"> <li>• <b>Microfloral inactivity</b> (due to microbial nutrition defc or disruption)</li> <li>• <b>Causes:</b> <ul style="list-style-type: none"> <li>- Poor quality roughage diet (defc in protein, CHO's) (late hay, lignified hay or straw)</li> <li>- ABs or plant poisons foul up microbes</li> <li>- Prolonged anorexia (#1 cause)               <ul style="list-style-type: none"> <li>• Simple indigestion</li> </ul> </li> </ul> </li> <li>• Results in m break down &amp; impaction of rumen w/ feedstuff</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Rumen distention</b></li> <li>• ↓ Feces (dry, undigested feedstuff)</li> <li>• ↓ Growth</li> <li>• Ketosis</li> <li>• Emaciation</li> <li>• Poor hair coat</li> </ul> 	<ul style="list-style-type: none"> <li>• History, CS</li> <li>• <b>Palpate hard rumen</b> <ul style="list-style-type: none"> <li>- Decreased ruminal motility</li> </ul> </li> <li>• Dry feces w/ undigested feedstuff</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Restore rumen environment</b> <ul style="list-style-type: none"> <li>- Feeding: correct feeding error, fresh green grass</li> <li>- Transfaunation</li> <li>• Oral fluids (to distend &amp; stimulate rumen)</li> </ul> </li> </ul> 
		<b>Inactive microflora, Poor hay, Prolonged anorexia</b> CS: Distention, Emaciation, Poor hair coat Dx: Hard, Atonic rumen Tx: Transfaunation, Oral fluids		

## Grain overload,

### Lactic acidosis,

Rumen impaction, CHO engorgement, Acid indigestion, Toxic indigestion, Grain engorgement, D-lactic acidosis  
Mk 175; C3T 714; C2T 716; IM 837; VO/S 276; BR-hb 100; BR 262; Br 634; DC 107; GI 719; Pa 24; Pic 62

\*\*\*

- **Dramatic acute diz.** m/b lethal 24 hrs
- **Cause:**
  - Engorge on fermentable CHO (carbohydrates)
    - Feedlots: introduction to grain
    - Accidental access to grain
    - Cereal grains w/o sufficient roughage, also fruits & root crops (beets, sugar beets, potatoes); silage
    - Roughage incr. buffering saliva
  - Fermentation of CHO to lactic acid (rumen pH  $\leq$  5)
    - Disrupts flora: kills lactate-utilizing org. (protozoa & bacteria) &  $\uparrow$  lactate acid producing organisms (gram positive bacteria [*Strep. bovis* & *Lactobacilli*])
  - Systemic acidosis
  - Dehydration: osmotic pressure rises & pulls fluid into rumen from circulation
  - Diarrhea: osmotic press. rise in intestine
    - $\uparrow$  Liver, cardiac & renal function
- **Severity:** depends on adaptation to grain, 20 lb m/ cause death if unaccustomed to grain
- **Groups > single** (competitive gluttony!)

### $\uparrow$ Lactic acid, Rumenal flora

### CS: Indigestion; Toxemia

Dx: CS, Hx, Rumen atony, Lab: pH < 5

Tx: Empty rumen, Fluids

## Rumen alkalosis

IM 839; C3T 714; BR 74; Br 635

\*\*

- Uncommon, Rumen pH 7-7.5
- 1° in poor digestible roughage
- Soya bean or high protein engorgement
- Fermentation reduced & saliva continues
  - Prolonged anorexia
  - Poorly digestible roughage
  - Simple indigestion
  - Excess ammonia NPN (nonprotein nitrogen)

## CS in 12-36 hours

### • Simple indigestion

- Full rumen
- Bloat (rumen atony)
- Colic (kicking belly)
- Anorexia, BAR
- Diarrhea common
- Reduced rumenal movements
- Returns to eating 3-4 days

### • Fatal toxemic acidosis

- Complete anorexia, depression
- Recumbency w/ head to flank
- Temp. below normal 98-101° F
- Resp. shallow & rapid 60-90/min (acidosis)
- Elevated HR
- Profuse, wet diarrhea (sweet odor)
- Dehydration
- CNS: ataxia, stagger
- $\pm$  Anuria due to dehydration
- $\pm$  Die in 24-72 hours

### • Sequela to recovery

- Chronic poor doers (rumenitis, liver abscesses)
- Laminitis (histamine release?)
- Metabolic alkalosis
- Fungal rumenitis, abscesses
- Hepatic abscesses, peritonitis
- Abortion (days - weeks later)

- History, CS
- Ruminal atony w/ gurgling sounds
- Dehydration,  $\uparrow$  PCV

- Lab:
  - Low ruminal pH < 5 (severe acidosis)
  - Ruminal flora (no protozoa)
  - Gram stain change from Gr neg to Gr + bact
  - $\pm$  Urine pH 5
  - Blood pH < 7.2

### DDx:

- Parturient paresis (no diarrhea/dehydration) (p 148)
- Coliform mastitis (p 195)
- Peritonitis (p 63)
- Urolithiasis (p 96)
- Polioencephalomalacia (p 140)

- History, CS (poor doer)
- Rumen pH alkaline

- Rumen content dark grey w/ putrid odor

## • Mild to moderate

- Restrict grain & water
- Provide hay & exercise
- Activated charcoal (1 lb/1000 lb) + mineral oil (1 gal/1000 lb)
- $\pm$  Magnesium hydroxide (500 g/1000 lb) into rumen (antacid) early
- **Toxic - emergency**
  - Consider slaughter if serious CS
  - Restrict water 18-24 hours
  - Empty rumen
    - Large stomach tube (add water & gravity drain) 15-20 times
    - Rumenotomy & siphon
  - Transfaunation
  - Fluid therapy
  - Good quality hay during recovery
  - Thiabendazole (anthelmintic) helpful to control 2° mycotic infection

### Prevention:

- Avoid sudden changes in diet
- Adequate roughage
- Bring onto full feed gradually

### Prognosis (Px):

- Poor: peracute recumbency
- Good: less acute standing cases
- Good: if pH > 5, HR 70-85, ruminal contractions, & willingness to eat w/in 3 ds
- Poor: HR 120/140 poor
- Grave: Mycotic infection w/ relapse

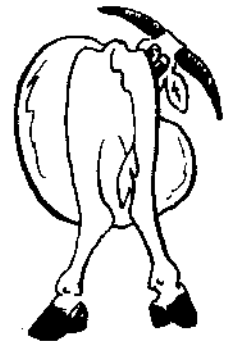

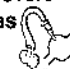

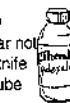

- Electrolyte w/ excess chloride (Ringer's ) 30-50 L over 24 hours
- Concentrate feeds
- Good quality hay
- Transfaunation

# Bloat

26

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment

### • Pasture frothy bloat

- Predisposed in some animals
- Feedstuff - protein content & rate of digestion
- Legumes (high prot. & ground quickly to fine particles)
- Lush pastures w/ high % of rapid growth

### • Feedlot frothy bloat

- Uncertain, m/b species of bacteria producing insoluble **slime** (traps bubbles)
- Finely ground feed - promotes stable foam

### • 2° Free gas bloat

- Related to failure to eructate
- Rarely due to excessive gas production, but 2° to problem with eructation

### Causes of free bloat

#### • Cardia constriction or obstruction:

- Recumbency
- Overconsumption of fluid (drinks too much)
- Lymphadenopathy of caud. mediastinal Inn.
- Abscesses in lungs
- Choke (foreign body)
- Tetanus
- Abscesses in esophagus

#### • Rumens atony

- Grain overload
- Anaphylaxis
- Hypocalcemia (milk fever)
- Endotoxemia
- Vagal nerve damage

#### • Tension receptors in cardia nonresponding

- Ruminantitis
- Esophagitis

### Diagnostic approaches to bloat

#### • History is very important

- Sternal or lateral recumbency?
- Acute vs chronic
- Diet: sudden changes?
- Other diz problems? toxic mastitis? endotoxemia?
- Pressure on esophagus due to enlarged Inn.?

#### • Vital signs

#### • Evidence of colic or abd. pain?

#### • Rumenal contractions, strength & how often

#### • Acute severe bloat is an emergency!

#### • Frothy bloat puts pressure on resp. tract. Also an emergency!

#### • Rumens intubation - treats & identifies problem

#### - If can't open mouth, think tetanus

#### - Stomach tube

- . If doesn't pass = esophageal obstruction
- . If passes easy, but doesn't relieve gas = frothy bloat
- . If passes, resistance, then sudden release of gas = blocked cardia &/or pressure on esophagus
- . If passes easily & releases gas - rumenal stasis where gas can't get to cardia

#### • Palpation & ballotment - consistency of rumen

- Frothy bloat is one consistency throughout
- Free gas bloat is like punching a balloon

### Rumen fistula

#### • Rumencostomy, in left flank, high so in dorsal sac (not at fluid line)

- 2" skin incision
- Grid muscle layers & incise peritoneum
- Grasp rumen w/ towel clamps
- Incise rumen & suture edge to skin edges w/ simple continuous suture
- Opening should be able to accept a quarter
- Gridded muscles act as valve, opening when distended, closing when relaxed
- Can lose large amounts of heat in cold climate through fistula
- Fistula routinely heals if cause of bloat is corrected

#### • Ranchers often use a large knife to relieve bloat

- The vet then later sees the animal

### Prevent FREE GAS BLOAT

- 1° underlying diz
- Get in sternal recumbency if on side
- Fast animal prior to any surgery to reduce substrate

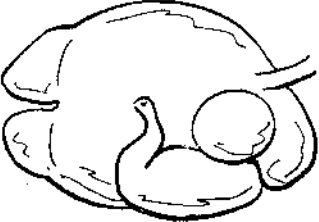

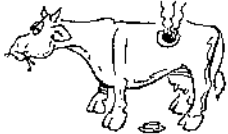

### Prevent FROTHY BLOAT

- Proloxaline blocks (Bloat guard®, Therabloat®)
- Proloxaline feed mix (must be given daily)
- Added prevention for pasture frothy bloat
  - Difficult - management
  - Hay before pasture
  - Restrict grazing to 20 min. 1st few days
  - Strip grazing
  - Pre-bloom pastures most dangerous
  - Antifoaming agents - oils, fats & nonionic surfactants (automatic dosing syringe, in water or feed, painted on flank)
- Added prevention for feedlot frothy bloat
  - 10-15% chopped roughage
  - Rolled or cracked grain, not finely ground

# Ruminant Indigestion

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment - Prognosis

## Vagal indigestion

### Hoflund's syndrome, Abomasal reflux

Mk 179; CST 730; IM 830, 834; VC/S 382, 412; BR-1b 105, 108; BR 284, 292; Br 640, DC 116; GI 725; S-J 527; Pic 65

\*\*\*

- Group of dzs impeding passage of ingesta from reticulorumen &/ or abomasum
- Mimics transection of vagus n. innervation to forestomachs & abomasum
- Paralysis of rumenal stomach
- Delayed passage of ingesta, two 1° syndromes (some divide into four)
- Adults, rarely in cattle < 2 yrs old

- Type 1 • Omasal transport failure**
- Paralysis of reticulo-omasal orifice
  - Accumulation of ingesta in reticulum & rumen
  - Omasum/abomasum empty (relatively)
  - Mimics cutting the ventr. & dors. vagal n. trunks
  - Rt. med. wall of reticulum tension sensory receptors (vagus n.) damaged

- CS Both types**
- Anorexia/indigestion
  - Dehydration
  - Papple bloat (filling, not gas)
  - Loss of weight
    - Starvation, missed bec. of abd. distention
  - Little feces
    - ↑ Ruminal motility or atony
    - Rumen contents homogenous, not stratified

- CS Omasal transport failure:**
- Adult cows > 2 years
  - Indigestion
  - ↓ Milk production
  - Will drink water
  - Mild to moderate dehydration
  - Electrolytes normal, serum & rumen

- CS 
- Exploratory lap.
- Rumenotomy
- Lab:
  - Omasal block
  - Electrolytes normal
  - Pyloric block
  - Hypochloremic metabolic alkalosis

- Slaughter; or 
- Slow response to Tx, depends on status of animal & if rumenal motility
- Exploratory laparotomy for cause (most cases) 
- Correct underlying problem
- Relieve distention, critical
  - Large bore stomach tube 
  - Sx remove rumenal fluid
- IV fluids (40 L m/b necessary)

- Transfaunation
- Limit feed & water (palatable, hi-fiber)
- Poor does if from hardware diz or persists after calving
- Large fetus causing obstruction
  - Remove fetus, resolves
  - C-section
  - Dexamethasone to induce labor

### Causes of Type 1

- 1° hardware disease
  - Adhesions in omasum
  - Abscesses
- Liver abscesses (p 36)
- Diffuse peritonitis (p 53)
- Reticulitis 
- Obstruction of reticulo-omasal orifice (neoplasia, FB, papilloma, ingested placenta, Actinomyces granuloma)
- Leakage from abd. viscera
- Adhesion on rt. med. wall
- Reticular herniation thru diaphragm

### Causes of Type 2

- Volvulus of abomasum (p 40) (most common)
- Displaced abomasum (p 40)
- Sx correction of above, abomasum atonia
- Abomasal ulceration - leakage into peritoneum w/ adhesion or abscess formation (p 31)
- 2° to advanced pregnancy, large fetus compressing pylorus

1 • "Omasal block" Normal electrolytes  
 2 • "Pyloric block" Hypochloremic metabolic alkalosis  
 CS: "Papple", Starvation  
 Dx: CS, Laparotomy, Rumenotomy, Lab  
 Tx: Slaughter or Relieve bloat, Fluids, Transfaunation  
 Px: Guarded to poor

- Type 2 • Pyloric outflow failure**
- Paralysis of pylorus (outflow of abomasum, not stenosis, but mimics)
  - Ingesta accumulates in abomasum, omasum & reticulorumen
  - Internal vomiting into reticulorumen (distention)
    - ↑ Cl in rumen (peripheral Cl decr.)
  - Cause: disruption of vagus to pylorus?

- CS pyloric outflow failure:**
- Marked dehydration
  - Hypochloremic metabolic alkalosis
  - ↑ Cl in rumen

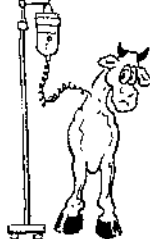

### "Papple" - distention

- Apple shape to lt. side of abd. (rumen, ventral & dorsal sac) &
- Pear shape to rt. side (ventral sac)

# Abomasum

# DIGESTIVE SYSTEM

## Abomasal ulcer diz

MK 156; C2T 740; C3T 735; IM 874, 385; VC/S 284, 295, 415; BR-hb 112; BR 304; BM&S 667; BR 199, 649; DC 132; GI 721; S-J 528; Pa 25; Pic 24, 66

\*\*\*

- 1° adult dairy cows & calves (rare in small ruminants)
- **Specific cause unknown**
- **Assoc. w/ stress**
  - Intensive management & high grain (starch) diets
  - Dairy cows - parturition, onset of lactation & grain fed
  - Calves (dairy, veal & feedlot) pushed for weight gain, sudden dietary changes (milk to solid diet)
    - .. *Clostridium perfringens*
    - .. Copper deficiency
    - .. Hair balls (trichobezoars) commonly present in calves
  - **Lymphosarcoma assoc.**
  - Viral erosion of mucosa (BVD, Rinderpest)
- **Ulcer - full thickness erosion of mucosa**

Type I - nonperforating  
 Type II - non-perf., but significant bleeding  
 Type III - perf. ulcers w/ localized peritonitis  
 Type IV - perf. ulcers w/ diffuse peritonitis

#1 GI bleeding, Adult & calves, Stress  
 CS: Melena, Peritonitis - Perforation  
 Dx: Occult blood, Exploratory  
 Tx: Salvage, Diet, Stress, ABs, Fluids

Varies, dep. if complicated by hemorrhage or perforation - mild indigestion to death

### ADULT DAIRY COWS

- **Type I** (nonperforating or bleeding)
  - Mild abd. pain (shown by anorexia, decr. rumenal motility & mild rumen tympany)
- **Type II (Bleeding ulcers)**
  - Acute anorexia
  - Mild abdominal pain
  - Rumen stasis
  - Tachycardia (90-100 min)
  - ↓ Milk production
  - **Melena** (scant, dark, tarry, bloody stool)
    - ± Anemia, hemorrhagic shock, death in < 24 hours or subacute bleeding to hemorrhagic anemia, w/o melena (more common)
- **Types III & IV (Perforating)**
  - **Local peritonitis** - similar to Hardware diz
    - Fever, anorexia, ↓ milk production
    - Intermittent diarrhea
    - Pain in right cranial quadrant
    - Abates in 2 days (like hardware diz)
  - **Diffuse peritonitis** (rupture)
    - Shock & death in a few hours

### CALVES (no categories)

- Acute abdominal tympani
- Colic, general peritonitis w/ assoc. CS
- Often die

- **CS, History**
- **Fecal occult blood test** (inexpensive & done during PE)
- **Grunt test** - palpation behind xiphoid on right 
- **W/o melena difficult**
- **Exploratory laparotomy**
- **Lab:**
  - **Fecal occult blood test**
    - Several samples
    - Adult - hemorrhagic anemia 
  - **Bovine leukemia virus titers, if positive - cull**
- **Postmortem**
  - **Single or multiple ulcers** in fundic part of greater curvature 

### DDx:

- Distended abomasum
- Rt. displaced abomasum (p 40)

### Melena

- Duodenal ulcers (identical) (p 31)
- Hematomesis
- Abomasal torsion (p 40)
- Intestinal obstruction (p 44)
  - Intussusception (p 45)
  - Blood sucking parasites (p 56)

### Perforation

- Peritonitis (p 53)
  - Chronic Hardware diz (p 38)
  - Uterine rupture (p 113)
  - Cecal rupture

### Calves

- Chronic abomasitis (identical)

- **Salvage for slaughter** (since most occur 1st month post calving, most common Tx because don't come back into lactation until next year)
- **Correct dietary problems**
  - Calves - feed small amounts freq. instead of BID
  - Adults, trade starch w/ good quality hay & confinement 
- **Alleviate stress**
- **Tx ulcer problems**
  - Whole blood transfusions - PCV < 14% (4 L. once usually enough, Sx unrewarding for bleeding ulcers)
  - **ABs** - broad spectrum for peritonitis 
  - Antacids (magnesium oxide following copper sulfate sol. to close gastric groove into abomasum)
  - **IV fluids** in animals not eating & drinking (careful in diffusa peritonitis because of pulmonary edema due to hypoproteinemia)
- **Bovine leukemia virus titers + ulcers = cull**
- **Surgery for perforation** (carefully break adhesions so don't get spillage. Exteriorize to resect, oversew & replace) 

### Prognosis:

- Nonbleeding/nonperforating - good 
- Stop bleeding & local peritonitis - guarded 
- Chronic ulcers - poor 
- Diffuse peritonitis - death 

### Control:

- Change dietary management
- Avoid sudden changes in diet
- Include adequate roughage
- Minimize stress

## Ketosis

## DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Fat cow syndrome, Fatty liver syndrome</b> Mk 444, C3T 315; C2T 742, 324; C3T 315, IM 937; BR-hb 521; BR 1354; VC/F 436, 269; BM&S 689; Br 598; GI 624, 829; Pa 88 <b>***</b> 	<ul style="list-style-type: none"> <li>• Similar to pregnancy toxemia but different cause</li> <li>• Hi-production dairy cows postparturient               <ul style="list-style-type: none"> <li>- Common in loose housing where all cattle fed same diet</li> <li>- Adults &gt; heifers</li> </ul> </li> <li>• <b>1st 2 wks of lactation</b> (up to 1 month)</li> <li>• Pathophysiology:               <ul style="list-style-type: none"> <li>- High producing dairy cows</li> <li>- Overfeeding (lactation diet) in late pregnancy/dry period</li> <li>- Obese cow at calving</li> <li>- Anorexia of calving (neg. energy balance)</li> <li>- Sudden energy demand of lactation</li> <li>- Mobilizes fat deposits of body                   <ul style="list-style-type: none"> <li>.. # Ketosis, Acetonemia, Ketonemia Nervous ketosis

Mk 446; CST 309; C2T 317; IM 1455; BR-hb 519; BR 1343; VC/F 253, 385, 436; BM&S 539; Br 590; DC 419, 497; GI 828; N-L 262

\*\*\*

- **Metabolic diz of lactating cows**
  - Ds to few wks postcalving (w/in 6 wks)
  - Economic loss - decr. milk production & return to full prod.
- **Fat or thin, housed dairy cows** (pasture cows in Southern hemisphere)
- **Cause**
  - **1° ketosis:** predisposing factors
    - . Excessive silage (butyric acid)
    - . Inadequate exercise
    - . Obesity at parturition (fat cow syndrome)
    - . Inadequate fiber intake (digestive upsets)
    - . Lush pastures (low nutrients hi water)
    - . Mineral delcs: P, Na, Mg, Cobalt + reduced feed
  - **2° ketosis:** anything causing anorexia in early lactation
    - . Metritis, mastitis, displaced abomasum, Hardware diz, peritonitis, etc.
- **Cause**
  - Acetic, propionic, butyric acids (VFA) made by rumen microbes
    - . Propionic major glucose precursor
    - . Butyric acid (ketogenic)
  - Lactation overwhelms glucose stores of liver, raids fat & promotes ketosis
  - Glucose demand (CNS needs)

- **Subclinical**
  - **Anorexia** (don't eat conc. but continue to eat roughage)
  - **Weight/condition loss**
  - **Drop in milk production**
  - Constipation
  - Mucus-covered feces
  - "Glazed" eyes
  - Humpback m/b (colic)
  - **CNS CS:** circling, staggering, licking, bellowing, hyperesthesia, head pressing, apparently blind, trembling
  - **Acetone breath**
- **Subclinical:** no CS, but excrete ketones
- **CS of other dize**
- **Self limiting**

### DDx:

- Fat cow syndrome (p 32)
- Listeriosis (CNS not transient) (p 143)
- Rabies (always fatal) (p 144)
- Tetanus (p 145)

- **History, CS**
- **CS or other dize**
- **Smell breath (acetone)**
- **Lab**
  - Hypoglycemia (< 25 mg/dl, norm - 40-50)
  - Ketonemia (> 30 mg/dl, norm < 10)
  - ketonuria not definitive
  - Acetest®, Ketostix® urine or milk to rule out ketosis if neg.
- **Response to Tx**

- **Glucose IV** (500 ml 40% sol) alleviate, lasts 2 hrs
- **Glucocorticoids IV** (prednisolone 100 mg, dexamethasone 10 mg)
- **Propylene glycol PO** (glucose precursor bid)
  - Add cobalt salt in deficient areas
- **Rapid return to full nutrition** (hay & whole oats)
- **Other treatments**
  - Chloral hydrate if nervous form (PO bid 3-5 d)

### Prognosis:

- **Rarely fatal**, self limiting, once lactation stops, glucose demand stops
- **Return to milk production important**

### Prevention

- No overly fat or thin cows
- **↑ Plane of nutrition started 2 weeks before calving** (reduced lactation diet) to allow microflora to adjust to lactation diet)
- **Increase energy after parturition**
  - Maximum glucose precursors
  - Minimize hay crops or silage hi in butyric acid precursors
  - Good quality roughage minimum of 1/3rd of ration
    - . Alfalfa hay, 3 kg/100 kg body weight
  - If concentrates used - readily digested carbohydrates
  - Adequate vitamins & minerals
  - If high concentrate diets, divide into 4 feedings/day
- **Daily exercise**
- **Problem herds:** monitor ketone levels in milk & urine
  - Supplement susceptible cows w/ oral propylene glycol

**Fat or thin - Lactation peaks before intake = Mobilizes fat (Ketosis)**

**CS: Weight/Condition loss & CNS**

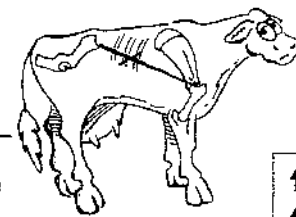

**Dx: Hx, CS, Acetone breath, Ketones & Hypoglycemia, Tx response**

**Tx: Glucose + Steroids + Propylene glycol + Feed**

# Liver Disease

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/SC	Diagnosis	Treatment

## Mycotoxins - Hepatotoxin

\*\*

- See TOX pg 232; **Aflatoxin & Rubratoxin, Toxic metabolites of molds, Grow on feed** (grains, corn, cottonseed), Calves > adults cattle > sheep
- **CS: Liver failure, Acute liver insufficiency**
- **Dx: Analysis of feeds for mycotoxin conc., Liver biopsy** (central lobular fat infiltration & hepatic, necrosis, fibrosis)
- **Tx not usually successful, Activated charcoal slurry orally & oxytetracycline IM**

## Ragwort poisoning,

Pyrrolizidine alkaloid toxicity  
\*\*\*

- See TOX pg 233, **P. plants: tansy ragwort & others, alkaloids, cumulative & progressive, chronic disorder; Fibrosis, West USA**
- **CS: Liver failure, Wt. loss, Hepatoencephalopathy** (abnormal behavior, ataxia, wandering), Icterus (uncommon in cattle), Photosensitization
- **Dx: Difficult w/o Hx of eating, Geographic area, Feed analysis, Liver biopsy** (Triad: Megalocytosis, **Fibrosis**, Bile duct proliferation)
- **Tx: Euthanasia:** if severe fibrosis, Remove plant source, If appetite & little fibrosis treat for liver failure
- **Px: Poor to grave** due to tremendous amount of fibrosis

**Hepatic neoplasia** (IM 945; GI 835; Pa 105) **\* Rare in cattle** < 0.01%, Metastasis of lymphosarcoma (2°) • **Tx: None**

**Waste oil ingestion** (spread to control dust), tetrachlordibenzodioxin. • **Tx: supportive, additionally show acute signs after being exposed fairly recently. Use of intestinal protectants and/or cathartic is indicated**

**Telangiectasia** (IM 945; Pa 88) • "Sawdust livers", focal degeneration in liver lobular circulation (red-brown foci 1-5 mm in diameter) found at slaughter.

\*\*

Cause unknown, Results in condemnation of 2% of livers of slaughtered cattle

**Cholangitis** (Mk 138; IM 948; CT 263; BR-hb 121; BR 324; GI 837; S-O 470) • **Inflammation of bile system; Result of fascioliasis**

\*\*

• **CS: anorexia, pain, ruminal stasis, icterus**

**Neoplasms of gall bladder** (IM 948) **\* Rare** (most adenomas or adenocarcinomas, 1 case reported of bovine leukosis)

**Bile stones, Cholelithiasis** (Mk 138; IM 947; GI 793; Pa 108) • **Calculi (bile stones) in bile duct, Cholelithiasis:** presence of calculi in bile duct. Cause debatable. Postmortem finding in cattle: Icterus. Decr. milk production, Hypophagia reported before slaughter

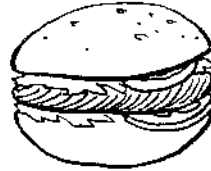

\*

• **Dx: Findings postmortem**

## Liver

## DIGESTIVE SYSTEM

**Beef; Rumenitis, Ulcers, Navel ill, Hardware diz**  
**CS: Subclinical = \$ loss (↓ feed efficiency, Condemned livers)**  
**Dx: Decr. wt. gain • PM: liver abscesses**  
**Tx: Salvage**

**Liver neoplasia**  
 BR-hb 120, BR 324  
 ★ Rare

- **Diffuse peritonitis:** Abscess rupture into abdomen
- **Anaphylactic shock & death:** due to release of purulent material from abscess into the caud. vena cava • CS: collapse & death w/in minutes or acute resp. distress & live for several days • Px: grave
- **CVCT** (caud. vena caval thrombosis): • CS: Weight loss, emaciation, mild ascites, chronic diarrhea (like Johne's diz), Distention of Mammary veins, but not jugular veins
- **Epistaxis:** abscess in lungs from liver abscess embolus in caud. vena cava, abscess erodes pulmonary artery • CS: intermittent epistaxis, weight loss, decr. milk • Px: slaughtered after poor Tx response
- **Severe dyspnea:** thrombosis into caud. vena cava to lungs, anaphylaxis

## Liver flukes,

### Fascioliasis, Hepatic fascioliasis

Mk 215, C3T 755; C2T 757; IM 933; BR-hb 470; BR 1230; BM&S 69  
3; Br 238, 815; DC 182; GI 833; Pa 99; Pic 71

\*\*\*

#### *Fasciola hepatica*

- **Common liver fluke** (leaf-shaped)
- West & gulf coasts & Rocky Mt. region (endemic)
- **Cattle:** subclinical, develop resistance to repeated infec.
- **Sheep:** acute cases, no resistance to repeated infec.
- ***Fascioloides magna*** (giant liver fluke)
  - Cattle encapsulate to stop migration
  - Sheep - not encapsulated, so migrate, can kill lambs
- Migratory larvae damaging liver
  - **Fibrosis**/finally sclerosis of bile ducts
- Summer & early fall (liver fluke season)

#### • Liver diz CS

- 1 • **Chronic** - often fatal in sheep, rarely in cattle
  - All seasons
  - Emaciation, Unthrifty, Rough hair coat/Brittle wool
  - **Anemia**
  - Edema & ascites 
  - ↓ Milk production
  - May have no CS in cattle
  - Heavy infection in sheep - Fatal
- 2 • **Subacute/acute** - 1° sheep & often fatal
  - Seasonal
  - Distended, painful abdomen 
  - Anemia
  - Sudden death (w/in 8 wks - acute; 7-10 weeks - subacute) in sheep
  - **In conjunction w/ "Black diz"**
  - Mainly sheep (fatal)

#### • No pathognomonic CS

- **Operculated, oval eggs in feces** (repeated fecals, ± negative for 16 weeks after infection)
- **ELISA & DOT-ELISA**
- **Rapid card test** (ELISA) for antibodies for field work 
- **Postmortem:**
  - Migratory tracts & flukes in bile ducts; immature in parenchyma

- **Anthelmintics** reduce in host animals
  - Adult & immature: nitroxyimil, triclabendazole, diamphenetide, closantel
  - Adults: Clorsulon, Alfanzolate, rafoxinide, netobimin - to eliminate flukes
  - 2nd dose in 8 weeks

**Prognosis: Good cattle, Poor sheep**

#### Control

- **Reduce snail pop.** (drain land, fence, management & molluskicides)
- **Preventative herd health program**
- Tx for flukes
- Reservoir infect. in horses, deer & rabbits complicate control

#### Life cycle

- Eggs pass in feces
- Hatch in water
- Infect lymnaid snails
- Encyst on vegetation
- Eaten by host
- Penetrate intestine to peritoneal cavity, then liver capsule
- Migrate through liver tissue
- Enter bile duct, mature & lay eggs
- Live in bile ducts

Sheep >> cattle, *Fasciola*, Snail

Liver migration/Necrosis

CS: Emaciation, Anemia

Dx: Capped egg

Tx: Anthelmintic

## Infectious necrotic hepatitis, Black diz

Mk 327; C2T 570; C3T 572; IM 921; BR-hb 289; BR 689; Br 564; Pa 99; Pic 72

\*\*\*

Sheep >> Cattle, *Cl. novyi* + Liver flukes; Vaccinate

- **Sheep** (1-4 yrs-old) & sometimes cattle
- ***Clostridium novyi*** infection
  - Type B, soil-born & intestines & skin surface
  - Transm. feces from carrier animals
  - Multiplies in liver necrosis (migrating liver flukes)
  - Powerful necrotizing toxin
- Worldwide distribution

#### • Sudden death usually

- Sternal recumbency, die w/in a few hrs

- **Postmortem:** necrotic liver fluke tracts

- **No effective Tx** (ABs in cattle)

#### Control

- Reduce snails (*Lymnaea* spp) intermediate host of fluke
- **Vaccinate w/ *C novyi* toxoid** more effective than snail removal 

**Bacillary hemoglobinuria - red water disease:** See Cardio pg 90, *Cl. hemolyticum* (also called *Cl. novyi* type D), Anaerobic

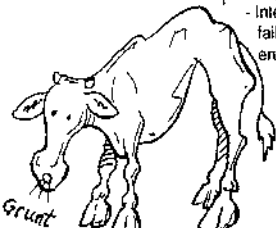

IM 846

conditions: Fluke infection; Hemolyzing exotoxin • CS: Jaundice & anemia, Port-wine-colored urine

•Tx: IV fluid support, High doses of penicillin, Vaccinate

*Cl. hemolyticum* bacterin • Px: Poor

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment

### DDx:

#### Pain

- Liver abscesses
- Abomasal ulcers
- Lymphosarcoma
- Laminitis (forelimbs)
- Pyelonephritis
- Rupture of abscesses (liver, rumenal, umbilical, renal, pelvic)
- Uterine rupture/torsion
- Septic abd. Sx
- Ruptured bladder
- Intraperitoneal injections
- Ruptured rectum
- Hernias
- Fat necrosis

#### Loss of milk abruptly & anorexia, etc.

- Ketosis or indigestion
- Acute systemic mastitis
- Metritis
- Enteritis
- Intussusceptions
- Cecal & abomasal volvulus
- Abomasal displacement

#### Respiratory

- Pneumonia

Cattle localize peritonitis well

#### Abdominocentesis

- Negativew findings doesn't rule out walled off peritonitis
- Peritoneal fluid normally clots in cattle
  - EDTA tube so doesn't clot (inhibits bact. growth)
  - "Clot" tube for culture
  - Smear if can't do analysis immediately & refrigerate rest (don't freeze)
- Volume: small in normal nonpregnant animal (m/b impossible to collect)
  - Large volume suggests abd. effusion or advanced pregnancy
- Color, norm. straw-colored, odorless, m/b slightly cloudy
- Frank pus, fibrin clumps or turbidity suggests peritonitis
- Ingesta - ruptured bowel or entering bowel w/ needle
- TP (refractometer) - of little benefit bec. of wide range (1-5 g/dl)
- Fibrin- of little benefit bec. of overlap of norm. (100-400 mg/dl) & peritonitis (100-800 mg/dl) levels
  - > 500 mg/dl peritonitis
- WBC count - difficult to interpret (norm. 1-20,000 cells/mm<sup>3</sup>)
- Peritonitis, PMN > 40% Neutrophilia (Lymphocyte-neutrophil reversal)

#### Rumenotomy

- Incision in left flank, just behind rib (not too close or m/ cause osteomyelitis)
- Feel adhesions in front of reticulum (break down adhesions; they will reform)
- Suture dorsal sac of rumen to skin outside incision, make water tight (w/ Connel & Lambert patterns, bites about 45°; outer edge of incision buried & not exposed to contamination from rumen)
- Incise into dorsal sac of rumen
- Pass hand inside along dorsal rumen into reticulum
- **Feel every mucosal square for FB (foreign bodies)** (if present, immediately remove or will not find it again)
- **Palpate for abscess on med. wall (slimy feel)**
  - Penetration point (large circular mass (omasum) also to left of right wall)
  - fV tubing, 16 gauge syringe & stick in, trying to get pus back
  - Draining back into reticulum, but must be sure of good adhesion (walled off peritonitis)

# Abomasal Displacement

40

# DIGESTIVE SYSTEM

## Abomasal displacement & volvulus (DC 124)

- Common
- **Man made diz** - metritis, mastitis, incr. conc. diets
- Gas accumulation in abomasum causes displacement to the lt. or rt.
  - **Atony** of abomasum due to **hi VFA** (volatile fatty acids) + continued fermentation = gas & distention
  - **Abomasum floats up wall on lt. or rt. side** (no ligg. holding abomasum down)
- LDA (left displacement) more common
- Adult dairy cows >>>> others
- Early postpartum period commonly

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>RDA,</b> <b>Rt. displaced</b> <b>abomasum -</b> <b>Abomasal</b> <b>volvulus,</b> <b>RTA, Rt. torsion</b> <b>of abomasum</b></p> <p>Mk 153; C3T 725; C2T 726; IM 870; BM&amp;S 675; BR-hb 110; BR 296; Br 648; DC 129; GI 738; Pa 23; S-J 526, 538; S-N 125; S-O 436, 457 VC/S 409</p> <p>***</p> 	<ul style="list-style-type: none"> <li>• <b>RDA ≤ 15% the frequency of LDA</b> <ul style="list-style-type: none"> <li>• RDA, pathophys., clin. path. &amp; epidemiology same as LDA</li> </ul> </li> <li>• <b>RTA</b> (Right torsion of abomasum)                             <ul style="list-style-type: none"> <li>- <b>Surgical emergency</b></li> <li>• <b>Cause uncertain</b> <ul style="list-style-type: none"> <li>- Stress, adverse weather</li> <li>- Hi conc. diet</li> <li>- Concurrent diz</li> </ul> </li> </ul> </li> <li>• <b>Epidemiology</b> <ul style="list-style-type: none"> <li>- <b>Early lactation</b> - greatest risk for RDA, but not for RTA, postpartum</li> </ul> </li> <li>• <b>RDA probably leads to abomasal volvulus (RTA)</b></li> <li>• <b>Sequela</b> <ul style="list-style-type: none"> <li>- Vagal type 2 indigestion</li> </ul> </li> </ul> 	<ul style="list-style-type: none"> <li>• <b>RDA similar to LDA</b> <ul style="list-style-type: none"> <li>- "Ain't doing right" - vague</li> <li>- <b>CS</b> not total obstruction</li> <li>- Moderate to total anorexia</li> <li>- ↓ <b>Feces</b> (variable)</li> <li>- ↓ <b>Frequency</b> of rumenal contractions</li> <li>- ↓ <b>Milk</b> (hypogalactia)</li> </ul> </li> <li>• <b>RTA</b> <ul style="list-style-type: none"> <li>- <b>More severe</b> than RDA or LDA</li> <li>- <b>Dehydration</b> (sunken eyes)</li> <li>- <b>HR &gt; 100 beats/min</b></li> <li>- <b>Marked bilateral distention</b></li> <li>- <b>Colic</b> rare (even w/ distention)</li> <li>- <b>Feces</b> absent or scant/watery</li> <li>- <b>Death</b> w/in 1-3 ds of volvulus</li> </ul>  </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Auscultation &amp; percussion</b> <ul style="list-style-type: none"> <li>- <b>RDA "Ping"</b> under last 5 ribs in dors. abd. **Surgical Emergency - RDA & RTA**

**CS: RDA - "Ain't doing right" • RTA - More severe**

**Dx: "Ping" on right, Rectal**

**Tx: Emerg. Sx, Fluids, ABs, Steroids & NSAIDs**

**Surgery - Correction of RDA & RTA**

(NEVER leave Rt-sided displacement, Sx immediately)

- Right paralumbar approach
- **RDA**
  - Make sure no volvulus
  - Rt. flank omentopexy, or Right paramedian abomasopexy
- **VOLVULUS (RTA)**
  - Think twice about laying down (very sick)
  - **Untwist**, very enlarged, most twisted counterclockwise
  - **Alternatively decompress gas w/ needle & untwist**
    - Place purse string suture bec. fluid also in abomasum
    - Cut through serosal layer, not mucosa
    - Needle w/ small tubing through mucosa
    - Tighten purse string around tubing (under a lot of pressure)
    - Once decompressed easy to untwist
  - **Stabilize w/ omentopexy**
  - Must warn owners that cow may go down due to impaction & vagus n. damage

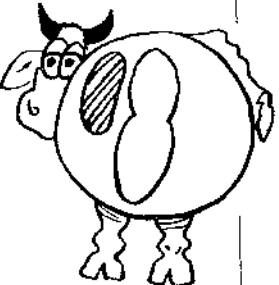

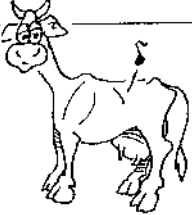

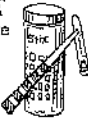

**DDx:**

- **Right-sided "pings"**
  - Cecal distention, or volvulus (linear pings below transverse processes to tuber coxae) (p 49)
  - Gas in spiral colon (variable pings, palpate rectally)
  - Pneumorectum following rectal exam (pings like cecal distention)
  - Pneumoperitoneum (heard on both sides)
  - Gas in uterus/physometra (rectal palpation)
  - Abomasal volvulus (most difficult to DDx) (p 40)
- **Intestinal obstruction**
  - Torsion around root of mesentery (rectal: distended loops) (p 45)
  - Cecal volvulus (p 49)
  - Intestinal obstruction (p 44)

<p><b>Common, Hi conc. diet, Concurrent diz</b></p> <p><b>CS: "Ain't doing right"</b></p> <p><b>Dx: "Ping" on lt. side</b></p> <p><b>Tx: No emergency; Reposition abomasum</b></p>				

## Repositioning the abomasum

### • Nonsurgical

- Cast cow in right lateral recumbency
- Roll into dorsal recumbency & shake legs back & forth (jiggle gas filled abomasum up to a ventral position)
- Roll cow over to left lateral recumbency & allows to stand
  - Complication rare (torsion of intest. mass)
- **Recurrence** of LDA in a few days usually

### • Surgical (outcome usually satisfactory)

#### 1. Blind-stitch abomasopexy

- Advantage: no celiotomy (opening abdomen), cheap
- Must have displaced abomasum w/ air & "ping"
- Cow cast in rt. lat. & then rolled to dorsal recumbency to move abomasum back to ventrum (see nonsurgical above)
- Use stethoscope to make sure "ping" in correct position, clip area
- Push special 8 cm needle through body wall & hopefully abomasum, through mucosa, maybe 2 stitches
- Hope for adhesion
- Special toggle pin fixation (bar suture) - toggle connected to sutures
- **Complications** - abscess, herniation, suturing rumen, pyloric obstruction, death

#### 2. Right flank omentopexy (done standing)

- Open right flank (be careful of descending duodenum)
- Bring abomasum under rumen to right side (if trouble, decompress w/ needle & extension tubing)
- Pull pylorus up to incision to identify (char. appearance)
- Let pylorus move 4" down, 4" forward of incision
- **Suture omentum into incision w/ peritoneum & transversus muscle**

#### 3. Rt. paramedian abomasopexy

(Most permanent fixation)

- Dorsal recumbency, no anesthetic used, front & hind legs extended. Clip ventr. abd.
- Incision hands width behind sternum & hands width to right of midline through rectus abdominis muscle
- Relocate abomasum & ID greater curvature (greater omentum attached)
- Locate reticuloabomasal lig. to locate cran. abomasum
- Suture 6" caudal to ligament, include abomasum in full length of closure w/ peritoneum & deep rectus sheath
  - **DO NOT go full thickness, but must include submucosa** or it will tear away (pinch between finger & thumb & will feel mucosa slip away)
  - Suture material PDS (absorbable, but lasts some time [Maxon®])
- Close muscle layer, then **superficial (external) rectus sheath**, 2-0 Vicryl® wide bites, simple interrupted
- Close SQ & skin

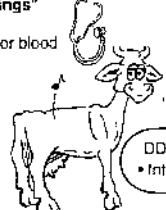

#### 4. Left flank abomasopexy (done standing)

- Incision in left flank close to ribs (abomasum must be displaced at time of surgery)
- ID greater curvature of abomasum (greater omentum attached to it & most dors. part in LDA)
- Pexy as far forward as possible
  - Suture (6 feet long), 4-5 bites into cran. greater curvature
- Push needle through ventral abdominal wall from inside
  - 1. hands width from sternum, 1 hands width to right
- Repeat with other end of suture
- Assistant takes sutures & ties as you push abomasum into proper position
- Leave for 3 weeks (good adhesion); cut exposed part of sutures
  - Advantage: stronger hold on abomasum & standing position
  - Disadvantage: hard to get sutures far enough forward to be in correct place

<p>#1 "flange"</p> <p>Rarely strangulate</p>			<p>DDx</p> <ul style="list-style-type: none"> <li>• Intussusception (p 45)</li> </ul>	

## Volvulus around root of mesentery

Mk 181; C3T 734; C2T 735; IM 881; Br 652; G 748; VC/S 456; S-J 546 \*\*

- Volvulus of large & sm. intest. around the mesenteric root
- Preruminant neonates most common (any age susceptible)

DDx: Grain overload (p 25)

### Preruminant neonate

CS: Colic, Abd. enlargement, Shock

Dx: Hx, CS, Palpation, Exploratory Sx

Tx: Emergency Sx

Px: Grave - Good if acute Sx

### Intussusception

Mk 161; C3T 733; C2T 734; IM 881; BR 309; BM&S 678; Br 654; GI 746; Pa 35; S-J 545; S-N 130; Pic 69

\*\*

intussusceptum

intussusciens

- Telescoping of a piece of bowel into an adjacent segment
- Infrequent cause of obstruction in cattle
- Jejunum of adults
  - Assoc w/ polyps or intraluminal masses propelled into intussusciens
- Calves associated w/ enteritis
- Pathophysiology
  - Venous return stopped, swells as arterial still pumps
  - Arterial supply then shut off
  - Ischemia & necrosis
  - If rupture, peritonitis
- Obstruction
  - Distends proximally
  - Empties distally
- Strangulation - necrosis

- Colic (kicking)
  - Acutely, tension on the mesentery, then subsides in 24 hours
  - Chronically: distention of prox. gut (treading & repeated lying down & standing)
- Depression, anorexia, milk drop
- Gradually shocky & dehydrated
- Abdominal distends, pear-shaped, then rounded
  - Rumen distends (continued digestion = line particles & reflux from abomasum)
  - Sm. intestinal distention - rt. side
- Absence of feces w/in hours
  - "Strawberry jam" feces if bowel necrotic

Obstruction - Distends prox., Empties dist.

CS: Colic distention, "Strawberry jam" feces

Dx: "Pings" on rt., loops, "Strawberry jam", Alkalosis

Tx: Surgical resection

- Painful colic (violent kicking & vocalization)
- Recumbency & dehydration
- Rapid abdom. enlargement
- Circulatory shock early (incr. HR & RR 120/min)
  - Cold extremities
- Rapid strangulation - clinical course short - Sx quick

- History, CS
- Percussion & auscultation
  - Calves - resonant sound, bilat.
  - Adults - tympany on rt. side (rumen on other side)
- Succussion - fluid splashing
- Rectal palpation
  - Distended loops & tense abd.
- Exploratory laparotomy
- Lab:
  - Metabolic alkalosis early, then
  - Metabolic acidosis (strangulation)

### Surgical emergency

- Sx correction only Tx
- Right flank & untwist

### Prognosis:

- Dep. on amount of devitalization & venous thrombosis
- Grave, not many saved
- Earlier Sx the better

### Auscultation & percussion

- Resonance on rt. side
- Rectal exam:
  - Distended loops
  - W/ palpate intussusception (firm mass)
  - "Strawberry jam" (very dark red feces + mucous)
- Abdominocentesis
  - Incr. RBCs, WBCs & protein
  - Bacteria if rupture
- CBC
  - Neutropenia & elev. fibrinogen
- Exploratory (if done standing, lay down for resection)

### Neonates

- Abdominal palpation w/ both hands m/ find intussusception
- Neutrophilia
- Hyperfibrinogenemia

Intussusceptum (prod gut) propelled by peristalsis into intussusciens (enveloping portion)

### Surgical resection (never reducible)

- Incision hi in caud. rt. flank
- Fluid & electrolytes
- When stabilized after surgery - oral electrolytes & fluids

### Prognosis:

- Good if Sx early & peritonitis controlled

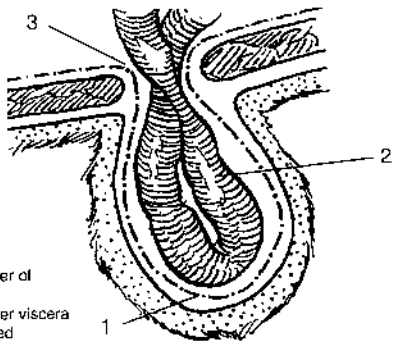

### DDx:

- Abomasal ulcers (p 31)
- Neoplasia (p 269)

# Umbilical Hernia

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation	Diagnosis	Treatment
<p><b>Intestinal incarceration, Internal hernia</b> IM 759; S-O 390; VC/S 417 *</p>	<ul style="list-style-type: none"> <li>• <b>Rare</b></li> <li>• Obstruction due to entrapment of loops (usually jejunum)</li> <li>- Embryonic structures (urachus, omphalo-mesenteric duct, umbilical vein, [round lig. of liver in falciform lig.])</li> <li>- Acquired defects in mesentery</li> <li>- Intestinal adhesions</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Obstructive CS</b></li> <li>- Colic</li> <li>- Depression</li> <li>- Anorexia</li> <li>- Absence of feces</li> </ul>	<ul style="list-style-type: none"> <li>• CS, History</li> <li>• Rectal palpation</li> </ul> <div data-bbox="881 266 1116 378" style="border: 1px solid black; padding: 5px; width: fit-content;"> <p><b>Rare</b> <b>CS: Obstructive</b> <b>Dx: CS, Hx, Rectal</b> <b>Tx: Sx</b></p> </div> 	<ul style="list-style-type: none"> <li>• Surgical correction</li> </ul>

<p>• <b>Diaphragmatic hernias</b> *</p> <p>C&amp;T 668; IM 834; BR-hb 167, 106; BR 421; Br 152, 288, 655; VC/S 490; S-J 523</p> <div data-bbox="112 918 291 960" style="border: 1px solid black; padding: 2px;"> <p><b>Resp. distress</b></p> </div>	<ul style="list-style-type: none"> <li>• Congenital</li> <li>- Peritoneal/pericardial hernias usually</li> <li>• Traumatic hernia</li> </ul> 	<ul style="list-style-type: none"> <li>• Weakness</li> <li>• Resp. distress</li> <li>• Slight coughing</li> <li>• Odontoprisis</li> <li>• Recurrent bloat</li> <li>• Capricious appetite</li> </ul> 	<ul style="list-style-type: none"> <li>• History, CS</li> <li>• Auscultation: abnormal lung sounds, muffled heart sounds</li> </ul> 	<ul style="list-style-type: none"> <li>• Congenital: no reported successful Tx</li> <li>• Traumatic:</li> <li>- Surgical repair - ventral approach, if calf old enough to ruminate, empty the rumen via rumenotomy 1st, mesh implants m/b used for large defects</li> </ul> 

• **Abdominal hernias** (S-J 551) • Sequela to trauma in late pregnancy • Usually salvaged because surgery not economical

**• Umbilical hernia**

Mk 111; IM 331; BR-hb 649; BR 1653; Br 151; S-J 551; VC/S 499; S-O 47, 391; S-N 84; S-UG 53; Pld 17, 19

\*\*\*

- **Common in calves**
- 1° DDx for lumps on bellies of calves
  - Can palpate complete ring in linea alba, no thickening, just sac
  - Lined w/ peritoneum
  - Great variation in size of hernial sac &/or hernial ring
- **Congenital** (at birth)
  - Occasionally umbilical hernias develop after infec. & are not consider inherited
- **Abscesses of umbilicus** common cause of hernia

- **Uncomplicated hernia** (most common) no adhesions or strangulation
  - **Reducible through hernial ring**
  - **Incarceration:** bowel, pyloric part of abomasum or greater omentum
  - **Strangulation very rare**
  - Abscesses m/b present w/ hernia, or just abscess & no hernia
    - Urachal abscess
    - Umbilical abscess

- History, CS
- Palpate
- Physical exam
- Needle aspiration

- **Uncomplicated hernia**
  - **Small reducible hernias m/ disappear in time**
  - **Young calf - pressure bandage around body a few weeks**
  - **Older calves: Surgical** correction (see box)
- **Abscess & hernia**
  - Open & drain abscess, flush w/ Betadyne®
  - Repair hernia later - hernia m/ heal after abscess drained
- **Urachal abscess** (urachus extend from umbilicus to apex of bladder)
  - **Must resect urachus & tip of bladder**
  - 2 inverting nonperforating layers in apex of bladder (must be water tight)
- **Umbilical vein abscess** in patent vessel
  - **Liver abscess**
  - More difficult to handle

Umbilical vein passes in free edge of falciform lig. to liver, continued as the ductus venosus through liver in the fetus, Umbilical v. becomes round lig. of liver.

**Sx** always check for infection (open abd.)

- Fusiform skin incision, open to abdomen to break down adhesions, check for abscess & viability of intestine, cut out hernial ring & close abdomen
- Marlex® mesh or Proxplast® rarely required to fill wall defect, can't place if infection

**Umbilical hernia in male**, just in front of prepuce

- 2 elliptical incisions from front of hernia back past prepuce
- Inverted U-shaped incision around cran. end of prepuce
- Suture so inverted Y-shaped suture line
- Legs of "Y" on either side of prepuce

**CS: Reducible, Strangulation rare**  
**Dx: Palpation, Sx**  
**Tx: Sx reduction, "Vest-over-pants"**

**• Inguinal/scrotal hernia**

C3T 734; C2T 735; VC/S 458; S-J 552; S-N 87

\*

- **Mature bulls**
- Loop of gut into int. inguinal ring
- Predisposition: congenital enlargement of int. inguinal ring
- **Almost always left inguinal ring**
- Problems when gut becomes strangulated, if large ring then m/ slide in and out w/o problems for years

- None if not obstructed or strangulated
- **Strangulation**
  - Acute abdominal pain
  - Tympany
  - Abdominal distention
  - ↓ Fecal output
- Enlargement at neck of scrotum sometimes

- History, CS
- **Rectal palpation of int. inguinal ring**
  - Always check in intestinal obstruction

- **Emergency surgery**
  - Left of right paralumbar laparotomy on standing bull, or ventr. approach over inguinal canal at neck of scrotum
  - Postsurgical hydrotherapy if swelling
  - Check fertility before surgery

**Mature bulls - Left inguinal ring**  
**CS: Strangulation/Obstruction**  
**Dx: Rectal palpation of inguinal rings**  
**Tx: Surgery**

**DDx:**

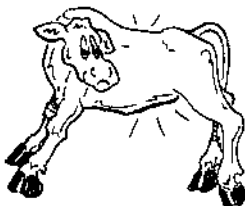

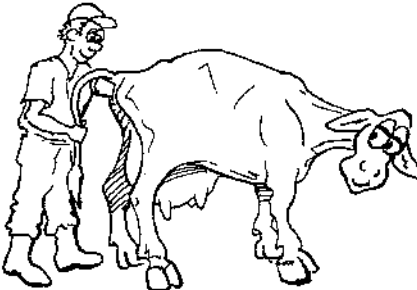

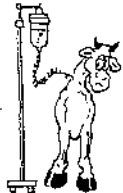

- Intussusception (p 45)
- Torsion around root of the mesentery (p 45)

**Prevention:** m/b hereditary, owner can decide to breed or not

# Obstruction

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Ileus, Pseudo-obstruction</b> Mk 161; IM 884; Pa 34 ★★</p>  <div data-bbox="104 845 668 991" style="border: 1px solid black; padding: 5px;"> <p>Lactating, Mimics obstruction, Cause? ## Cecal dilation & volvulus

Mk 161; C3T 739; C2T 734; IM 882; BR-hb 114; BR 308; BM&S 679; Br 653; DC 142; GI 743; S-J 547; S-O 465; Pic 68

\*\*\*

- Associated w/ parturition (postpartum)
- Changes to concentrate diets from roughage
  - Cecal flora metab. CHO's into VFA (volatile fatty acids)
  - VFA reduce motility of cecum + gas = distention
- Distention m/ lead to volvulus
- **Volvulus:** twisting of cecum & proximal loop of ascending colon

DDx  
• LDA  
• RDA

- **Dilation** (not total obstruction)
  - **Vague signs, gradual onset**
  - ↓ Feed intake
  - ↓ Milk production
  - Mild abdominal pain
  - Distended rt. paralumbar fossa
  - Still passes feces
- **Volvulus** (total obstruction)
  - **Abrupt CS**
  - **Right paralumbar distention**
  - Anorexia
  - Agalactia
  - Marked abd. pain
  - Tachycardia
  - Forestomach stasis
  - Manure scant or absent

## • DILATION

- Auscultation - resonance
- cranial to tuber coxae
- Rectal exam

- **Distended apex** in or near pelvic cavity

## • VOLVULUS

- Large area of resonance
- Ballotement - fluid in cecum
- Rectal - exam

- **Distended cecal body** (apex cranial)

## • BOTH (more extreme in volvulus)

- Metabolic alkalosis
- Hypochloremia
- Hypokalemia

## • DILATION:

- **Medical** if not tightly distended
- Antacid/laxatives -  $Mg(OH)_2$
- IV or oral fluids
- Coarse, high fiber diet (take off conc.)
- IV or SQ Ca in lactating cows
- **Sx** if recurrent distention or no response to medical
- Typhlectomy (see box)
- **VOLVULUS:**
  - **Sx** necessary
  - Incision cranial right flank
  - Untwist & decompress, see if need typhlectomy (see box)
  - Fluid management (K, Cl & alkalosis)

## Prognosis:

- **Depends on degree of ischemia**

## Dilation (partial obstruction) • Volvulus (total)

CS: Dil: vague • Volv: abrupt CS

Dx: Resonance, Rectal, Alkalosis

Tx: Dil: Medical or Sx • Volv: Sx required

## Surgery on cecum

- Incision caud. rt. paralumbar fossa, pull ommental "curtain" cranially to see cecum
- Incise apex of cecum, remove fluid, double inverting closure
  - If contracts down & peristalsis when pinched, close abdomen
  - If discolored or remains distended, remove cecum

## Typhlectomy (remove cecum) leave only ileoceocolic junction

- Double layer closure, inverting (Parker-Kerr)
- If volvulus involves prox. loop m/ not be able to save ileoceocolic junction
- Need to anastomose ileum to viable colon
- Cecal a. in ileocecal ligament on anti-mesenteric side needs to be preserved

## Colonic obstruction

C3T 740; DC 145

\*\*

- Partial or complete
- Cause:
  - Intraluminal obstruction (adult dairy cattle)
    - **Enteroliths** in spiral colon (small diameter)
  - Extraluminal compression
  - Fat necrosis, lymphosarcoma, adhesions from peritonitis

- Identical to cecal torsion, or ceocolic volvulus
- Partial
- Gradual & progressive
- Mild dehydration

## • History, CS

- Electrolyte & acid-base abnormal in complete, not in partial
- Tympanic resonance in right paralumbar fossa

## • Rectal:

- Scant feces
- Distended loops of bowel (small & large intestine)

## • Surgical exploration

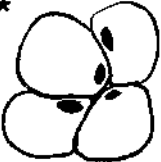

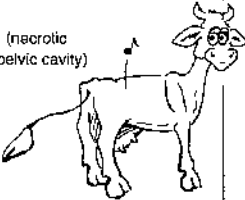

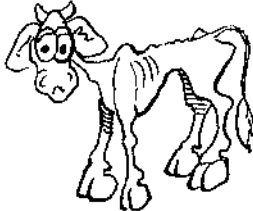

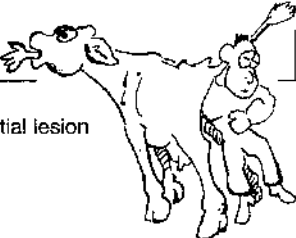

## • Exploratory celiotomy to Dx

- **Enterolith:** massage gently until broken down
- If firm inject DSS (dioctyl Na sulfosuccinate) into to soften
- Incise & remove (usually not necessary)
- Extraluminal compression
- Sx identification
- Attempt to free colon
- If can't be freed: side-to-side colocolic or ileocolic anastomoses

# Obstruction

## Rectal prolapse

C3T 741; C2T 740; BR 229; Br 665; VC/S 468; S-N 137; Pic 74

\*\*\*

- Common
- Highest incidence in Herefords

- Prolapse of rectum

- Obvious

- Tx often frustrating
- Salvage for slaughter 
- Replace rectum
  - Epidural anesthesia
  - Purse string suture
- Submucosal resection in long standing cases

### Prevention

- Castrate bull calves

### Common, Tenesmus

CS, Dx: Prolapsed rectum

Tx: Slaughter, Replacement frustrating

### Caused by tenesmus

- Diarrhea
- Frequent coughing
- Obesity
- Vaginal prolapse/irritation
- Coccidiosis
- Bull calf mounting cows
- Pyrrolizadine alkaloids

### Intestinal tumors

IM 883

★

- **VERY RARE** in cattle
- Relatively high in sheep in some areas of world

- Protracted weight loss to death
- Rarely signs of obstruction

- Rectal palpation of intraluminal mass or annular constriction of jejunum or ileum

- **Sx unsuccessful** (due to undetected metastases)

## Intestinal atresia or stenosis

IM 880; C3T 742; C2T 738; BR-hb 89; BR 230; DC 146; GI 750; S-J 551; S-N 468

★★

- **Uncommon**
- Congenital in calves & lambs
- Stenosis or atresia of GI tract
- **Most hereditary** (anal & rectal atresia)
  - **Atresia ani** - usually lethal gene
  - **Rectovaginal fistulas**, feces out vagina
  - **Colonic atresia** - palpation of amniotic vesicle at 42 ds
  - Commonly spiral colon doesn't join rest of ascending colon

- **CS w/in a few ds of birth**
- Depression
- Not suckling
- Cardiovascular collapse
- Tympani

- **Atresia ani**
  - No anus - obvious!
- **Atresia of GI**
  - Digital palpation of rectum
  - Absence of feces, m/b mucus
  - Contrast radiographs (cautiously)

- **Surgical repair for salvage, not for breeding**

### Prognosis:

- **Poor** w/ surgery - stasis & peritonitis common
- Death w/o Sx

### Sx of intestinal atresia

- Rt. flank incision
- Find 2 ends, open proximal & squeeze out meconium
  - Side-to-side or end-to-side anastomoses to descending colon (bec. blind end small usually)
- If registered should tell breed registry (w/o telling owner? Ethical??)

**Atresia ani** - must close any rectovaginal fistulas if surgically correct atresia ani

### Uncommon, Hereditary

CS: w/in few ds of birth

Tx: Salvage or Sx

# Peritonitis

52

# DIGESTIVE SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
-----------	-------------	-----------------	-----------	-----------

**Pancreatitis** (GI 917) ★ Rare in cattle & seldom manifested clinically unless there is insulin deficiency

## Diabetes mellitus

CIT 917; BR-hb 122; BR 325

★

- Rare, but reported in cattle • Cause: not acute pancreatitis as in dog; neoplasia, absence of beta cells & chronic pancreatitis, foot & mouth dz
- CS: Hyperglycemia, glycosuria, polydipsias, polyuria, weight loss
- Tx: Protamine zinc insulin SQ BID m/b helpful
- Px: poor

## Pancreolithiasis

CIT 917

★

- Rare; concretions in pancreatic excretory ducts: usually incidental finding on necropsy (82% of animals over 4 yrs)
- CS: rarely associated w/ clinical signs

## Atrial fibrillation

★

- See Cardio pg 81; Assoc. w/ gastrointestinal dz 75-95% of time, Common in adult cattle, Not assoc. w/ heart dz
- CS: GI DZ, Anorexia, decr. milk prod., Rapid & disorganized heart sound (review S1, S2) described as irregularly regular heart beat
- Dx: Dx underlying GI dz, CS, ECG - P waves replaced w/ undulating F waves, Irregular P-R interval, QRS complexes irregularly spaced
- Tx: Tx underlying GI dz CS should resolve, if continue after 5 ds: Quinidine + IV fluids, If HR > 120/min - Digoxin then quinidine, but rare
- Px: Good if not underlying heart dz or chronic GI dz

## Candidiasis

Mk 342; CBT 525; Br 764

★

- Mucocutaneous dz, Worldwide, yeastlike fungus, *Candida albicans*, Common inhabitant of oral mucosa & GI
- Implicated in bovine oral, GI, & vaginal infections, abortion & mastitis
- CS: GI: calves w/ forestomach • Candidiasis - water diarrhea, anorexia & dehydration progressing to prostration & death
- Resp: Pneumonia, dyspnea, mod. fever
- Dx: Scraping or biopsy from mucocutaneous lesions, Ovoid budding yeast cells
- Tx: Nystatin ointment or amphotericin B, iodine for oral or cutaneous infec.

## Muromycosis

Mk 348

★

- Fungi of order Mucorales (Mucor, Absidia, Rhizopus, Mortierella, Rhizomucor), inhabitant of soil, manure & rotting vegetation
- Often 2° to metabolic disorders or immunosuppression, Granulomatous lesions in several organs: skin, GI, lymph nodes; Placentitis & abortion in Bovid
- CS: Nonspecific reflecting organ involved, Pneumonia m/b, Anorexia, pyrexia, persistent diarrhea, Neurological disturbances
- Dx: Antemortem Dx uncommon • PM: fungal ID, microscopically, FA, cultures
- Tx: No completely satisfactory Tx, Surgical excision of supf. lesions, amphotericin B

## Peritonitis

Mk 146; IM 861; C3T 719; BR-  
hb 90; BR 233; Br 655; DC  
151

\*\*\*

- **Peritonitis:** inflam. of mesothelia lining the abd. cavity & covering the viscera
- **Common**
- **Local or general:**
  - **Cattle wall off** infections better than other species
- Acute or chronic
- Hematogenous spread
- **Septic component inflammatory response**
- Stimulates pain receptors
- Fluid into peritoneal space (circ. hypovolemia)

### Causes:

- #1 hardware diz in cattle
- Abomasal ulcers
- Lymphosarcoma
- Pyelonephritis
- Rupture of abscesses (liver, ruminal, abomasal, umbilical, renal, pelvic)
- Uterine rupture/torsion
- Septic abd. surgery
- Ruptured bladder
- Intra-peritoneal injections
- Ruptured rectum (iatrog.)
- Hernias
- Fat necrosis
- Acute systemic mastitis
- Metritis
- Enteritis
- Intussusceptions
- Cecal & abomasal volvulus

- **Variable:** related to extent of lesion, generalized or local, host response, infecting organism & age of animal
  - Rumination ceases
  - ↓ Milk production
  - Anorexia & depression
- **CS - localized peritonitis:**
  - ↑ Heart rate, temperature
  - **Abdominal pain**, tends to resolve in 24-48 hours
  - **Kyphosis** (arching back, pain)

- **CS - generalized**
  - **Very shocky, septic shock**
  - ↑ HR, RR & temp.
  - Mucous membr. injected
  - Slowed refill capillary time
  - ileus
  - **Abdominal pain**
  - **Ascites** (pressure put on liver, lymphatics, etc.)

## History & CS

- "Skooch" test - abd. pain
- Percussion & palpation
- **Abdominal laparotomy**
- Stasis of GI tract
- **Rectal:**
  - Adhesions & distended intestines
- **Paracentesis**
  - Fluid w/ degen. lt. shift
  - Culture & cytology
- **Alkalosis** (Chloride sequestration w/ adynamic ileus)

### DDx:

#### Abdominal pain

- GI distention (p 25)
- Urinary tract obstruction (p 96)
- Reproductive tract pain
- Pleuritis (p 72)
- Myositis
- Multiple limb lameness

#### Septic processes

- Rumenitis (p 24)
- Toxic enteritis (p 250)
- Mastitis (p 192)
- Pneumonia (p 62)

## Tx cause

- **Fluid** - place an IV catheter
  - 20-40 L isotonic solution - adult
  - Monitor hydration w/ serial PCV & TSP
  - **Lactating cows** - 500 ml of 23% calcium gluconate to 1st 3 L of saline
- **ABs** Cult/sensitivity abdominocentesis
  - Broad spectrum: Naxcel®, Penicillin (gr +) + sulfonamides, Tetracycline & sulfonimides
- **Corticosteroids**, for endotoxic shock & to stabilize membranes
- **NSAIDs** for septic shock (Banamine® IV or IM, Phenylbutazone)
- Abdominal lavage? \$
- **Nursing care**, analgesics for sleep, sternal recumbency, fly control, bedding changes
- **Nutrition**, force feeding, parenteral for valuable animals

### Prognosis:

- **Localized Hd/dz - fair**
- **Diffuse - grave**

### Control:

- Prevent causes (Sx aseptic, Limit IP injections, magnet)

**Common, Causes: Hardware diz, Ulcers, etc.**

**CS: Localized (Pain) • Generalized (Septic shock)**

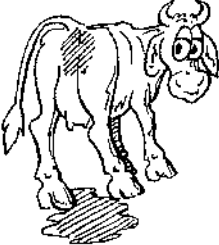

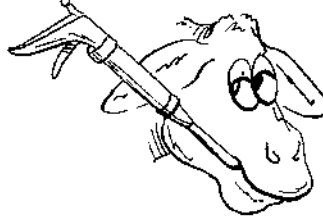

**Dx: Hx, CS, "Skooch test", Rectal, Paracentesis, Sx**

**Tx: Tx cause, Fluids, ABs, Steroids, NSAIDs, TLC**

## Ostertagiasis, Parasitism - diarrhea

Mk 205; IM 1701; Br 231; DC 180; GI 781, 808; Pa 31

\*\*\*

- ***Ostertagia ostertagi***
  - Medium or brown stomach worm
  - #1 nematode of cattle
    - . Most pathogenic & cause of most economic loss
    - . Control also controls other nematodes (see box)
  - Life cycle (see box)
- **Type I ostertagiasis** - reaction of larvae in gastric glands
  - **Albumin lost** into lumen
  - ↓ HCl production
  - Alkalinity to abomasum
- **Type II ostertagiasis** - caused by exit of larvae from gastric glands (hypobiosis)
  - Hyperplasia & loss of cell differentiation ("**moroccan leather**")
  - M/b sloughing of mucosa
  - Young beef & grazing dairy replacement cattle
  - **Rarely in older cattle** after 1st year on pasture

### Type I ostertagiasis

- < 2 yrs old, On pasture
- Anorexia, Poor growth
- **Diarrhea**
- Death

### Type II ostertagiasis

(emergence of arrested larvae, hypobiosis)

- **2-4 years** (m/b adults)
- Anorexia
- Unthrifty

- Hypoproteinemia
  - Submandibular edema

### • Diarrhea

- Anemia
- Fever
- ± Death

### Life cycle - Direct

- Ingested 3rd-stage larvae into gastric glands of abomasum
- Complete development in glands 4th stage
  - Can reenter lumen in 18 days
  - **Hypobiosis:** Arrested development, remain in glands for mos. (range 3 weeks - 4 months)
    - . Type II ostertagiasis occurs when they emerge months later

### #1 parasite, Controlling Ostertagia controls others

Type 1 infec. < 2 yrs

Type 2 infec. 2-4 yrs, Hypobiosis ("hibernating")

Dx: Hx, CS, Egg count, "Moroccan leather"

Tx: Ivermectin

### • Hx, CS

- Egg counts misleading because not specific or sensitive
- Postmortem
- "**Moroccan leather**" pathognomonic

### Peak pasture infec./Outbreaks

In the North:

- Summer - Type I
- Spring - Type II

In the South:

- Fall - Type I
- Spring - Type II

### Anthelmintics

- **Adult ostertagia**
  - Give before hypobiosis
  - . North - July
  - . South - Sept.

- **Hypobiotic larvae** (treatment & prevention of type II)

- **Ivermectin**
  - High dose of fenbendazole, albendazole
  - Repeated doses of Ivermectin m/b necessary to kill all
  - Drug withdrawal times

### Prognosis (Px):

- Type I - good
- Type II - damaged mucosa unlikely to recover
  - Profound hypoproteinemia & dehydration has worse Px

**Deworming program** (no single program fits all area & climate conditions, below is a starting point to greatly reduce Ostertagia problem including inhibited larvae)

### • Spring calving

- Deworm cows after calving season just before turning out to summer pasture
  - . Ivermectin, albendazole or hi-dose fenbendazole
- Deworm spring calves by midsummer (ideal)
- Deworm all stock in late fall (at weaning in beef calves)
  - . Move to clean pasture that day

### • Fall calving

- Deworm cows before overwintering
  - Deworm all stock in spring, before summer pasture
- Yearling spring calves & fall calves
  - Deworm in late spring
  - Deworm in summer if intensively grazed on summer pasture
- Beef entering feedlot
  - Deworm
  - All adults
  - Spring & fall minimum

Ideal

- Ivermectin at 5 wk interval or others at 3 week

### Toxocara infection, Ascarid (Mk 208; BR-hb 473; BR 1239; DC 180;

- Pa 47; Par 199)
- *Toxocara vitulorum*, Ascarid, stout whitish 1-1 1/4" long • Transm.: Ingestion of eggs, pass in milk, Calves < 6 mo old, older calves resistant
  - CS: Diarrhea, reduced wt. gain, anemia & steatorrhea; no CS in older animals
  - Dx: Eggs: Thick pitted shell
  - Tx: Ostertagia Tx controls, piperazine at 2 wks of age to expel worms before mature

### Oesophagostomum, Nodular worm, Pimply gut (Mk 208; DC 180; Par 163)

- *Oesophagostomum radiatum* (nodular worm), 1/2" long & head bent dorsally; Direct life cycle, Loc.: dist sm. intest. cecum & colon, M/ encyst in wall in subsequent infections (nodules)
- CS: Young (anorexia, weight loss, severe constant, dark fetid diarrhea); Older resistant animals (nodules, decr. motility of intestines, stenosis or intussusception occasionally)
- Dx: Nodules palpated per rectum
- Tx: control Ostertagia

### Chabertiasis, Largemouth bowel worm (Mk 208; BR-hb 487; BR 1273; DC 180; Par 162, 289)

- *Chabertia ovina*, 1/2" long & ventrally bent at anterior end • Direct life cycle enter sm. intest. mucosa & then emerge & pass to large colon • CS: Rarely see clinical chabertiasis in cattle, Mucus-coated feces • Tx ostertagia controls

### Trichuris (Mk 208; BR-hb 487; BR 1237; DC 180; Par 209)

- Common in calves & yearlings, Eggs resistant & persist in environment
- CS: Clinical signs unlikely (dark feces, anemia, anorexia)
- Tx: treatment of Ostertagia controls

### Moneizia, Tapeworm (Mk 208; BR-hb 472; BR 1237; DC 183; Par 132, 138)

- *Moneizia expansa*, *M. benedeni*, Lack rostellum & hooks, segments wider than long, Eggs triangular or rectangular • Life cycle: intermediate host oribatid mite, ingestion of mite, Young cattle
- CS: Non-pathogenic in calves, except in young; m/ cause failure to thrive, intestinal stasis has been reported
- Tx: treatment of Ostertagia controls tapeworms

### Nematodirus (Mk 207; Par 153)

- *Nematodirus helvetianus* most common, 1/2-1" long, Eggs highly resistant, m/ last til next season, Transm.: ingestion of larvae, Loc.: 1st 20" of sm. intestine, Dairy calves after 6 wks old
- CS: Diarrhea & anorexia
- Dx: Eggs in feces after CS
- Tx: control ostertagia

### Trichostrongyles (Mk 209, BR-hb 481; BR 1259; DC 180; Pa 49)

- Sheep, *T. colubriformis*, *T. vitrinus*, *T. rugatus*, Direct life cycle, Larvae burrow into crypts of intestine, Villous atrophy - impaired digestion & malabsorption, Protein loss across mucosa
- CS: Anorexia, Persistent diarrhea, Weight loss • Dx: Fecal
- Tx: control Ostertagia

### Haemonchosis, Barber pole worm (BR-hb 483; BR 1265; Br 247; DC 180; Pa 30; Par 152)

- *Haemonchus placei* (barber's pole worm, large stomach worm, wire worm), Large worm - 1" long, Abomasum, Immature cattle (immunity after 3 yrs), Warm weather, Suck blood from abomasum
- CS: Acute - Hemorrhagic anemia, ± Diarrhea, ± Constipation; Chronic - Weakness, lethargy, Weight loss, Submandibular edema (bottle jaw), Anasarca (generalized massive edema)
- Dx: Presumptive, SC, Hx, Fecal egg count, CS often before eggs in feces, not present w/ CS, Direct centrifuge flotation, Fecal smears not recommended • PM: Edema of abomasal mucosa, minute hemorrhages • Tx: Treat Ostertagia, flukicides, Move to uninfected pasture

### Cooperia (Mk 208; BR-hb 481; BR 1259; DC 120)

- Small intestine, Red, coiled adults - 1/3" long, males have a large bursa, Don't appear to suck blood
- CS: Heavy infestation - Profuse diarrhea, Anorexia, Emaciation, No anemia
- Dx: Eggs - parallel sides, larval culture for definitive Dx
- Tx: control Ostertagia

### Bunostomum, Hookworm (Mk 207; C1T 921; Br 247; BR 1257; DC 180;

- Pa 47)
- *Bunostomum phlebotomum* - 1" long, Hookworm, Warmer climates (tropics or subtropics), Direct life cycle, Ingestion or skin penetration, found in small intestines; Prepatent period 2 mo, Small numbers (2000) cause severe diz & death
  - CS: Larval penetration of legs (uneasiness & stamping), Rapid weight loss, Blood sucking (anemia), Diarrhea & constipation m/ alternate, Edema (Hypoproteinemia), bottle jaw rarely seen as in Haemonchosis • Tx: treating Ostertagia controls

### Strongyloides infection (Mk 207; DC 180; Par 48): *Strongyloides papillosus*,

- Only female in parasitic cycle, 1/4" small, prepatent period 10 d, Pass in feces & infect, or become free living adults & cycle to become infective, Young calves, esp. dairy
- CS: Rare (m/b diarrhea, anorexia & wt loss)
- Tx: Tx Ostertagia controls

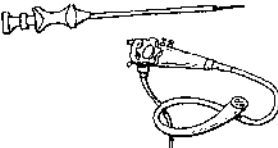

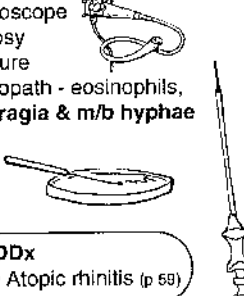

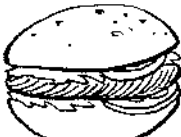

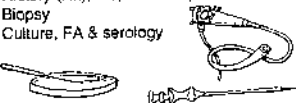

### Rumen flukes (BR-hb 471; BR 1236; Br 241)

- *Paraphistomidae*, commonly found in rumen, Conical shape, < 1/2" long (3-11 mm)
- No CS of rumen infestation, immature flukes burrow into mucosa of small intestine to get to rumen, m/ cause weakness, anemia & diarrhea
- Tx: carbon tetrachloride effective

# RESPIRATORY SYSTEM - II

**Allergic rhinitis,  
Summer snuffles,  
Atopic rhinitis,  
Nasal Granuloma** (pg 58)  
Mk 426; IM 621; BR-hb 170, 625;  
BR 426, 1622; Pa 126, 129  
**\*\***

- **Granuloma** (see pg 58)
  - Nasal obstruction
- Jerseys & Guernseys (Channel Island breeds) & Holsteins
- > 2 yrs generally (> 6 mo)
- **Type I hypersensitivity**
  - Severe rhinitis & conjunctivitis
- **Allergens**
  - Mold (fungal) spores
  - Plant pollens
- Summer & Fall
- Moist, warm conditions

**Granuloma, Allergy**  
**CS: Pruritus, Polyps**  
**Tx: Steroids**

- **Acute:**
  - Dyspnea
  - Stertorous inspiration
  - Thick nasal discharge, yllw to orange, bilat.
  - Swelling & inflam.- obstruction
  - Intense pruritus, sneezing, rubbing nose on ground
- **Chronic:**
  - Polyps - granulomas in nose, lobular appearance (see pg 58)

- If change environment CS abate or improve
- Endoscope
- Biopsy
- Culture, FA & serology
- **DDx from fungal granuloma because of different treatments**

- DDx:**
- Fungal granulomas (p 58)
  - Foreign body (p 59)
  - Resp. viruses (p 252)
  - Nasal actinomycosis or actinobacillosis
  - Irritant gases (p 210)

- Remove allergen
- Block hypersensitivity
  - Corticosteroids (anti-inflam dose)
    - . Dexamethasone IM/IV
    - . Prednisolone IM/IV
- Antihistamines - less effective
- Meclofenamic acid

**Prognosis:**

- Poor response once polyps formed

**Epistaxis**  
Mk 706; C3T 683; C2T 655; BR-hb 155, 170; BR 427  
**\*\*\***

- **Epistaxis: bleeding from nose**
  - Hemoptysis: blood originating from lungs
- 1° Trauma
- 2° to disease processes
  - Abscess in lungs from liver abscess embolus in caud. vena cava
  - . Abscess erodes pulmonary artery
  - Bleeding diz in Simmental cattle

- **Bleeding from nose**
- **Lung abscess** from liver abscess
  - Intermittent blood from nostrils
  - Weight loss
  - ↓ Milk production

- Causes:**
- 1° Trauma
  - Lung abscess (p 71)
  - Foreign body (p 59)
  - Polyps
  - Neoplasms (p 58)
  - Granulomas (p 58)
  - Thrombocytopenia (p 85)
  - Clotting abnormalities (p 84)
  - Bracken fern toxicity (p 84)
  - Moldy sweet clover (p 86)
  - Dicoumerol (p 86)

• **Bleeding from nose**

- Treat 1° diz
- For trauma give whole blood & expand the volume
- Prophylactic ABS
- Lung abscess
  - Slaughtered after poor Tx response

**Nasal foreign bodies (FB)**  
IM 621; C2T 655; BR 155; DC 65  
**\*\***

- Cattle >> small ruminants
- Aggressive eating habits

- Head shaking, Stridor
- Sneezing, Snorting
- Frequent nose licking
- Epistaxis m/b
- Nasal discharge

- History, CS
- PE
  - Visualization
  - Endoscope

- DDx:**
- Snake bite (p 215)
  - Allergic rhinitis (p 59)
  - Nasal actinomycosis or actinobacillosis (p 13)

• **Remove**

**Nasal trauma & fxs**  
IM 621; DC 65  
**\*\***

- Causes:
  - Fighting
  - Improper restraint
  - Human sadism
  - Large nasogastric tube
  - Foreign body (FB)

- Facial swelling
- SQ emphysema
- Obstruction
- Stertor
- Epistaxis
- 2° Bact. mucopurulent discharge

- History (Hx), CS
- Radiographs

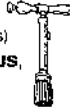

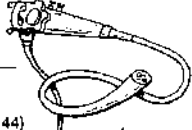

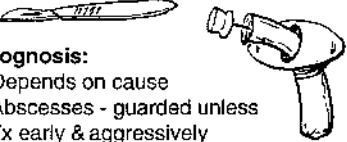

- DDx:**
- External swelling
- Snake bite (p 215)
  - Phlegmon
  - Nasal actinomycosis or actinobacillosis (p 13)

- Surgery generally not required, unless obstruction, severe depression fxs or sequestra
- **Prophylactic ABS**
  - Penicillin 22,000 IU/kg IM or SQ

**Calf diphtheria,**  
Laryngeal necrobacillosis,  
Necrotic laryngitis  
\*\*\*

- See GI (pg 12)
- **Fusobacterium necrophorum**
  - Necrotizing endotoxin
  - Invades broken skin & laryngeal cartilage
- **Necrotic stomatitis**
  - Calves < 3 months (2 wks - 6 mos)
- **Necrotic laryngitis**
  - Older calves, 6-18 months
  - Untreated some die 2-7 days from toxemia & upper airway obstruction
- **Necrotizing pneumonia**

- **Necrotic stomatitis** (see GI pg 12)
- **Necrotic laryngitis**
  - Moist, painful cough
  - Necrotic ulcers of vocal process of arytenoid, not in mouth
  - 1° **loud dyspnea** - obstruction
  - Nasal discharge, fetid odor
  - **Salivation**
- **Necrotizing pneumonia**
  - **Acute** (aspiration of infected tissue)
  - **Death**

- **History, CS, necrotic ulcers**
- Laryngoscope
- **Diphtheritic material**

- **Isolate** from healthy calves
- **ABs** - Mycotil, Sulfonamides, procaine penicillin (IM, not oral)

**Laryngeal obstruction**

- Tracheostomy if airway obstruction
- NSAIDs, incl. aspirin, Banamine®

**Control**

- Clean & disinfect feeding & drinking areas
- Daily PE all calves to find new cases

**Fusobacterium necrophorum**

**CS:** Dyspnea, Salivation, Nasal discharge

**Dx:** Laryngoscope

**Tx:** Isolate, ABs

**"Honkers",**  
Tracheal edema

MK 732; IM 621; Pa 131

\*\*\*

- **Feedlot cattle**
- **2 forms**
  - Acute dyspnea
  - Chronic cough
- **Cause unknown**

- **Loud guttural inspiration** (lower trachea)
- **Acute form**, Heavy feedlot cattle (> 900 #), Southern plains - Summer
  - **Dyspnea**, open-mouth breathing
  - Cyanosis
  - Recumbency & death (asphyxiation)
- **Chronic form**, Lighter cattle (300 - 900 lb), Western plains
  - **Continuous, deep, nonproductive cough**

- **History (Hx) (feedlot), CS**
- **Auscultate lower trachea**
- **Endoscope:**

- Endematous thickening of tracheal & bifurcational lining
- Cobblestone appearance
- Fingerlike projections or polyps

**Salvage**

- **No Tx** for chronic form
- **Acute form**
  - Broad spectrum ABs
  - Steroids (Dexamethasone, Prednisolone IV/IM daily)
  - Avoid stress, provide shade

**Prognosis:**

- Recovering patients tend to relapse so salvage

**Tracheal collapse, stenosis** \*

IM 629; BR-hb 172; BR 431

- **Rare**: Cause: unknown (blunt trauma, tracheostomies, congenital?); Calves - majority thoracic trachea (congenital)
- **CS:** Dyspnea (exacerbated by excitement), stertorous resp., "honking" cough, fever, cyanosis, ↑ HR & RR, BAR
- **Dx:** Hx, CS, auscultate trachea, palpate cervical trachea
- **DDx:** Tracheal FB, Tracheal actinobacillosis, Neoplasms, Bronchopneumonia, Necrotic laryngitis, extern. compression (abscesses, hematomas, TB)
- **Tx:** Mild cases - confinement & fattening. Prostheses have been used

**Tracheal foreign body (FB)** \*

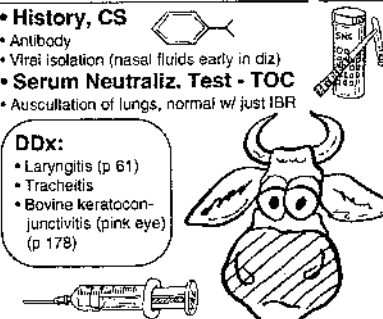

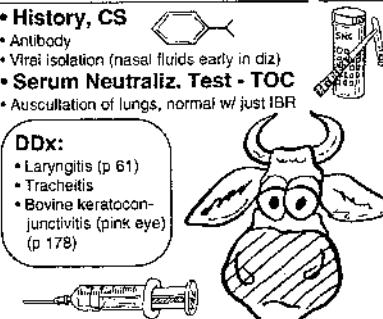

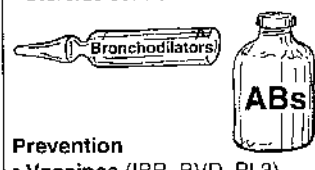

IM 630

- **Rare**
- **CS:** chronic cough, inspiratory dyspnea, stridor, extension of head & neck, open-mouth breathing, salivation
- **Dx:** Auscultation, Endoscope, Flads
- **Tx:** Remove object (endoscope snare); Tracheostomy

## IBR + Pasteurella = Bronchopneumonia (Shipping fever) (See below)

- 2° complication of rednose • Virus destroys mucous membrane of trachea, allowing bacteria to colonize; 10% more severe CS than upper resp. tract infection of IBR

### Broncho-pneumonia, Shipping fever, Pasteurellosis, Bovine pneumonic pasteurellosis, Transit Fever, Fibrinous pneumonia

Mk 723; C2T 670; IM 632, 639; BR-1b 309; BR 758; 6r253; DC 71  
\*\*\*

- **Multifactors**
  - #1 *Pasteurella hemolytica*, *P. multocida* & other bacteria also possible
  - . *Pasteurella* normal in upper resp. tract, but not in lung
  - . CS due to bacterial lesions of lungs
- + **Stress** - immunosuppression causes bacteria to proliferate & move to lungs
- + **Virus** (IBR, PI-3, BRSV, BVD) or mycoplasma, like stress, increases susceptibility to 2° bact.
- = **Bronchopneumonia**
- **Contributing factors to stress:**
  - Transport
  - Co-mingling of new animals
  - Change in diet from roughage to conc.
  - Underlying viral diz (e.g., IBR) causes immunosuppression
- **Morbidity up to 50%**

- **Respiratory problems**
  - 7-21 d after arrival at feedlot
- Found ill, hanging back from feed & water or dead
- **Depression, anorexia**
- **Nasal & ocular discharge**, mucopurulent (bacteria)
- **Fever**
- **Dyspnea**
- **Cough - productive**
- **Rapidly fatal**, esp. in young
- **Septicemia (USA free?)**

- **Sequela:**
  - Survivors m/b chronic poor doers

#### DDx:

- Pleuritis (p 72)
- Pleural effusion, e.g., due to hardware diz (1 animal) (p 38)
- Acute pulmonary emphysema (p 67)
- Fog fever (p 67)
- Pulmonary edema (p 67)
- Laryngitis (p 61)
- Tracheitis
- Lungworms (p 69)

- **History (Hx) (shipping) & CS**
- **Abnormal lung sounds**
  - Expiratory grunt
  - Initially wheezes, moist rales & crackles
  - Friction sounds
  - W/further consolidation sounds m/ decr.
- **Postmortem:**
  - Cranioventr. lungs dark red, swollen & hard, often covered w/ fibrin

- **Early Tx for best results**
- **Difficult due to \$**
- **ABs** (critical) - Mycotil®, Naxel®, long acting tetracycline, based on transtracheal wash & culture
- **Separate sick animals**
- **↓ Stress**, liberal water & hay
- **NSAIDs** (aspirin, Banamine®)

**Prognosis: Good** - 1-10% mortality

#### Prevention:

- **Precondition 3 weeks before shipping** (weaned & conc. diets, castrated, dehorned, resp. vac., Tx parasites)
- **Reduce stress** (↓ transit time, ↓ crowding & mixing, ↓ dust, proper ventilation & feed)
- Tx high risk calves w/ Mycotil® or oxytetracyclines IM + oral bolus of sulfamethoxine
- **Vaccination**

**Stress + Virus + Bact. = Bronchopneumonia, 1-2 wks after shipping**

**CS:** Resp. (fever, dyspnea, cough), Rapidly fatal

**Dx:** Hx, CS, Fibrin

**Tx:** ABs, Isolation • **Px:** Good

## Respiratory Disease

## RESPIRATORY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Bovine resp. syncytial virus, BRSV</b></p> <p>MK 722; IM 637; CST 447; BR-hb 408; BR 1051; DC 62</p> <p>***</p> 	<ul style="list-style-type: none"> <li>• <b>Paramyxovirus</b> <ul style="list-style-type: none"> <li>- Forms <b>multinucleated cells</b> (syncytial cells) (pneumocytes coalesce)</li> <li>- Destroys resp. epithelium</li> </ul> </li> <li>• 0-20% mortality</li> <li>• <b>Winter/Beef breeds</b> due to husbandry</li> <li>• No maternal ABs           <ul style="list-style-type: none"> <li>- Calves affected more severely</li> </ul> </li> <li>• <b>Two phases: 1st respiratory, 2nd hypersensitivity</b></li> <li>• Adults serve as reservoir</li> </ul> 	<p><b>Two phases</b></p> <p><b>1st phase</b></p> <ul style="list-style-type: none"> <li>• 104-108° F.</li> <li>• Anorexia, depression</li> <li>• Salivation</li> <li>• Nasal discharge</li> <li>• <b>Dyspnea</b></li> </ul> <p><b>Remission or progression</b></p> <ul style="list-style-type: none"> <li>- 2° <b>bact. pneumonia</b> common, M/b complicated by mycoplasma</li> </ul> <p><b>2nd phase:</b></p> <ul style="list-style-type: none"> <li>• <b>Hypersensitivity reaction (m/b)</b></li> <li>• <b>Severe pneumonia</b> <ul style="list-style-type: none"> <li>- <b>Dyspnic, lying down</b></li> <li>- SQ emphysema</li> </ul> </li> <li>- Submandibular edema (migrated along mediastinum)</li> <li>- <b>Calves spontaneously cough</b></li> <li>• Time between 2 phases 1 - 2 wks</li> </ul>  	<ul style="list-style-type: none"> <li>• <b>Difficult, due to other viruses causing similar CS</b></li> <li>• <b>Development of 2nd phase - severe pneumonia</b></li> <li>• <b>Cough</b>, easily elicited by tracheal palpation</li> <li>• <b>Difficult to culture in vitro</b></li> <li>• <b>Postmortem</b> <ul style="list-style-type: none"> <li>- Intracytoplasmic inclusion bodies</li> <li>- <b>Syncytial cells: multinucleated pneumocytes (coalesce)</b></li> </ul> </li> <li>• <b>Need to differentiate from other viruses because of different Tx</b></li> </ul> 	<ul style="list-style-type: none"> <li>• <b>ABs - preventive</b> (broad spectrum: oxytetracycline, sulfas, Naxcel®, etc.)</li> <li>• <b>2nd phase</b></li> <li>• <b>Corticosteroids</b> <ul style="list-style-type: none"> <li>- Dexamethasone, once</li> <li>- Then prednisone</li> <li>- Usu. get dramatic response</li> <li>- Contraindicated in other viral dzs</li> <li>- Steroid treatment? ## Other Viruses Isolated in Resp. Diz (IM 638; DC 86)

### Parainfluenza - 3 virus (PI-3)

Mk722; IM 637; C3T 443;  
C1T 546; BR 1051; DC  
85

\*\*\*

#### • Paramyxovirus

- All ages affected, 1° weaning calves
- Predisposes to lower resp. tract diz, shipping fever, but in itself little problem
- Majority of cattle have antibody levels to PI-3 (ubiquitous)
- Linked to bovine respiratory diz (BRD)
- Can cause diz alone, but probably 1° infection followed by Pasteurella as a 2° invader

#### • Most mild w/o 2° bacteria

- Fever, anorexia
- Serous nasal discharge
- Lacrimation
- Coughing
- CS develop after get to feedlot
  - Predisposes to 2° bact
- + Pasteurella = pneumonia
- Incr. severity of CS, Death

**Malignant catarrhal fever virus:** sporadic occurrence

**Other herpes viruses:** Serologically distinct from IBR, MCF & herpes mamillitis virus, Herpesvirus type 4, Several isolated from cattle w/ respiratory diz (DN-599, Movar 33/36, FTC-2); importance poorly defined, not thought to be important enough to warrant vaccine development

**Adenovirus (BAV):** Bovine adenovirus, DNA virus; infection often not apparent, assoc. w/ other viruses & bacteria; Assoc. w/ a wide spectrum of dizes (pneumonia, enteritis, pneumoenteritis, conjunctivitis, keratoconjunctivitis, weak calf syndrome & abortion

- CS of both upper & lower respiratory tract diz

**Rhinovirus:** RNA virus (picornavirus), Infection appears widespread

- CS: inapparent to fever, anorexia, depression, ↑ RR, lacrimation, conjunctivitis, salivation, coughing & nasal discharge

**Reovirus:** RNA virus; subclinical infection usually; importance unclear

**Enterovirus:** RNA virus (picornavirus); not considered pathogenic

**Coronavirus:** Established cause of diarrhea in young calves, role in respiratory diz?

**Calicivirus:** Isolated in calves w/ persistent respiratory diz

## Dx of Viral Respiratory Diz

- History, CS, Physical exam
- Specific viral Dx difficult w/o lab
  - Labs look for virus that has a vaccine
  - CBC & chem. rarely of value
  - Serum immunoglobulins useful for FPT (failure of passive transfer)
- Virus isolation: time consuming & expensive
  - Performed in cell cultures
  - Nasopharyngeal swabs, conjunctival swabs, tracheal lavage fluids, PM tissues
  - Place in virus transport medium & refrigerate (24 hrs) or freeze
  - Sample in acute phase of diz & asymptomatic contact animals (m/b incubating)
  - BRSV very difficult to isolate
  - Virus identification: neutralization of specific antiserum, fluorescent antibody staining, immunoperoxidase staining, electron microscopy, immunoelectron microscopy
  - Viral antigen detection: immunofluorescence (rapid) immunoperoxidase
  - Serological diagnosis: retrospective Dx, paired serum from individual animals 2-4 weeks apart. Detect antibodies, microliter serum-virus neutralization test, hemagglutination/inhibition test (PI-3). ELISA

Colostrum

## Tx of Viral Respiratory Diz

- **ABs to prevent 2° bact. infec.,** be aggressive & continue several days after recovery (Naxcel®, oxytetracycline, Tylosin, etc.)
- **NSAIDs** found to be helpful
- Corticosteroids reported helpful in BRSV infections, Dexamethasone (immunosuppressive) m/ cause recrudescence of IBR infec.
- **NO antiviral drugs** available in vet med.
- **Supportive care:**
  - Fluids
  - Vit. B-complex for anorectic animals
  - Selenium or copper supplementation if deficient
- Tx other concurrent dizes

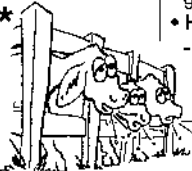

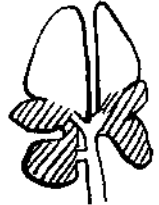

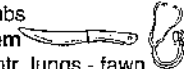

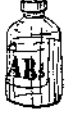

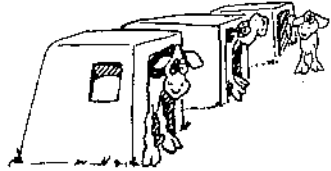

### Prevention:

- Management important
- **Vaccinations**
  - Not totally effective for a number of reasons (diverse etiology, few vaccines)
  - Vaccinate IBR, PI-3, BVD
  - BRSV vaccine requires 2 doses

# Respiratory Disease

# RESPIRATORY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment

## Acute Respiratory Distress Syndrome (ARDS)

IM 656, 363; Br 764; DC 91, 100; Tox 395

- Any resp. condition or sudden onset of dyspnea (usually severe), characterized by: Congestion & edema, Hyaline membranes, Alveolar epith. hyperplasia & Interstitial emphysema
- Examples: Fog fever (ABPE), Moldy sweet potato toxicity & Perilla ketone toxicity, Toxic gases

### Atypical interstitial pneumonia, Fog fever

Acute bovine pulmonary edema & emphysema (ABPE),

Acute respiratory distress syndrome (ARDS)

Mk 724; C2T 661; IM 656, 1888; BR-hb 183, 664; BR 408, 1665; Br 674

\*\*\*

- M/b ARDS
- Moving adults from dry sparse forage to lush green pasture
- L-tryptophane in lush forages converted by microorganisms into 3-methylindole
- Pneumotoxic compound (3-methylindole)
- Damages resp. epithelial cells, resulting in pulmonary edema, alveolar epith. hyperplasia, hyaline membranes
- = emphysema w/ severe dyspnea
- Pasture type unimportant, esp. lushness
- Fall, Western US, moving to lush pastures
- Morbidity up to 50%
- Mortality up to 30%
- Nursing calves & yearlings don't eat enough to get diz

### Acute severe respiratory CS

- Dyspnea, loud resp. grunt
- Frothing at mouth
- Mouth breathing
- Tachypnea (35-75 breaths/min)
- Distressed not depressed: stand w/ neck extended, head elev., dilated nostrils
- No coughing (DDx from infec. resp.)
- Death, brought on by mild exercise or handling
- 30% die w/in 2 days of onset
- Survivors improve after 3 days w/o moving off pasture
- SQ emphysema

### Adult herd/New pasture

- Severe resp. distress
- Absence of coughing
- Auscultation
- Surprisingly soft sounds (emphysema), soft crackles
- Harsh breath sounds, w/ crackle & wheezes in caud. lung lobes

### Postmortem:

- Congested, edema & hyaline membranes
- Histo.: multinucleated giant cells

### None may be best bec.:

- Handling may kill
- Removing doesn't prevent new cases
- Most deaths 1st two days
- Survivors recover - 10 days
- Some may develop emphysema
- Poor doers

### Prognosis:

- Guarded: 30% die, some on recovery are poor doers

"Fog" pastures: British term for lush regrowth after hay cut

Adult + Lush pastures (L-tryptophan) = ARDS (lung damage & edema & emphysema)

CS: Acute dyspnea, Death, No coughing

Dx: Hx (Pasture), CS, Hyaline membranes

Tx: None - Don't stress • Px: 30% die

### DDx:

- Acute respiratory distress syndrome (ARDS)
- Moldy sweet potato poisoning & perilla mint (pneumotoxins) (ID source) (p 67)
- Parasitic bronchitis (coughing) (p 69)
- Anaphylaxis (only 1 animal affected) (p 251)

### Prevention:

- Slowly introduce to lush pasture - gradually decr. hay in feed lot and incr. pasture - over a period of 10-12 days
- Delay lush pasture until after first frost
- Thoroughly graze lush pasture w/ young stock or sheep before older cattle
- Prophylactic - decr. conversion of tryptophane to 3-MI
- Monensin for 5-6 ds prior to putting on pasture

### Moldy sweet potato toxicity, 4-ipomeanol toxicity & Perilla mint toxicity (See Tox pg 225)

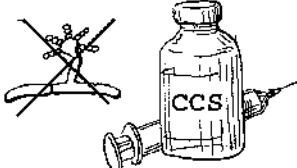

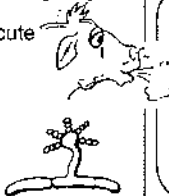

\*\*

- See PP pg 225 • Both produce ARDS; Sweet potato + fungus = pneumotoxin, Perilla plant (weed in SW) = pneumotoxin
- Damages cells - edema, hemorrhage, cellular necrosis, hyaline membrane formation - 2° emphysema
- CS, same as Fog fever • Dx: exposure to damaged sweet potatoes to DDx from fog fever • Tx: suggested same as fog fever

Toxic gases: See Tox p 210, can cause ARDS, Nitrogen dioxide, Zinc

## Lung Worm

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Hypersensitivity pneumonia</b> <b>"Farmer's lung"</b> MK 726; IM 662; BR-1b 666; BR 1689; Br 668; DC 102 **	<ul style="list-style-type: none"> <li>Inhaling organic dust</li> <li><b>Moldy hay</b> - spores of <i>Thermophilic actinomycetes</i> (<i>Micropolyspora</i> &amp; <i>Thermoactinomyces</i>)</li> <li>Wet summers (moldy hay) &amp; cold winters (housed cattle)</li> <li>&gt; 30% moisture content to hay - heats when baled - thermophilic molds proliferate</li> <li>Spores - hypersensitivity - destroys alveoli</li> <li>Confined adult cattle (dairy)</li> </ul>	<ul style="list-style-type: none"> <li>Animals in diff. stages</li> <li><b>Acute resp signs:</b> <ul style="list-style-type: none"> <li><b>Coughing</b></li> <li><b>Dyspnea</b>, tachypnea</li> <li>Dullness, ↓ appetite, hypogalactia, moderate transient fever</li> </ul> </li> <li><b>Chronic:</b> - Insidious onset               <ul style="list-style-type: none"> <li>Fibrosis</li> <li><b>Weight loss &amp; coughing</b> over several winters</li> <li>CS similar to acute</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>History (Hx) &amp; CS</li> <li>Auscultation: cranioventr. crackles</li> <li>Postmortem:               <ul style="list-style-type: none"> <li>Grossly normal lungs, small gray spots of lymphocytes</li> </ul> </li> </ul> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <b>DDx</b> <ul style="list-style-type: none"> <li>Toxic gases (p 210)</li> <li>ARDS (p 67)</li> <li>Fibrosing alveolitis</li> <li>Resp. dzs of housed adult cattle in winter</li> <li>Viral &amp; bact. pneumonia (fever &amp; consolidation)</li> </ul> </div>	<ul style="list-style-type: none"> <li><b>Remove moldy hay (\$)</b></li> <li>Corticosteroids (Dexamethasone IV)</li> </ul> <div style="text-align: center;">  </div> <p><b>Prevention</b></p> <ul style="list-style-type: none"> <li>Silage instead of hay</li> <li>Dry hay, feed outside</li> <li>Cull chronic cases</li> </ul> <p><b>Prognosis (Px):</b></p> <ul style="list-style-type: none"> <li>Good if Tx before fibrosis</li> </ul>
<b>Moldy hay - Hypersensitivity - Damages alveoli</b> <b>CS: Acute (Coughing, Dyspnea); Chronic (Wt. loss &amp; Coughing)</b> <b>Dx: Hx, CS</b> <b>Tx: Remove moldy hay, Corticosteroids • Px: Good if no fibrosis</b>				

**Contagious bovine pleuropneumonia** (Mk 726; IM 651; B-A 672) • USA free since 1892, highly contagious pneumonia generally accompanied by pleurisy  
 \* (Africa, Iberian peninsula, India & China; *Mycoplasma mycoides mycoides* • Reportable dz)

USA Free

<b>Chlamydia psittaci</b> IM 671; BR 437 **	<ul style="list-style-type: none"> <li>Contributes to some outbreaks of enzootic pneumonia in housed calves</li> <li>Pneumonia in range calves</li> </ul>	<ul style="list-style-type: none"> <li>Fever, depression</li> <li>Nasal discharge</li> <li>Dry hacking cough</li> <li>Dyspnea</li> <li>Diarrhea</li> </ul>	<ul style="list-style-type: none"> <li>Isolation from nasal discharges, trachea</li> <li>Inclusion bodies in affected tissue, FA, Complement fixation</li> <li>Postmortem: plum-colored lung lobes (like enzootic pneumonia)</li> </ul>	<ul style="list-style-type: none"> <li>Tetracyclines, large doses (11 mg/kg or more) 3 days</li> </ul> <div style="text-align: center;">  </div>
---	---	--	---	---

**Pulmonary listeriosis** \*  
 IM 671  
 • *Listeria monocytogenes*; Pneumonia resembling atypical pneumonia in feedlots, Stocker & feeder calves, Clinically indistinguishable from other bacterial pneumonias. Also causes encephalitis, abortions, septicemia, conjunctivitis & mastitis • Tx: Oxytetracycline & penicillin at high doses

**Coccidiomycosis** (MK 344) • Dust-born, noncontagious infec.; fungus/*Coccidioides immitis*, SW USA (arid) • Ruminants m/ have subclinical infection in lungs & lymph nodes of thorax

**Mycoplasma pneumoniae**: in goats, not cattle  
**Pneumocystis carinii pneumoniae**: also in goats, not cattle

**Pulmonary adenomatosis, Jaagsiekte, Pulmonary carcinoma in sheep:**  
 • Not in cattle

**Lung worm,  
Verminous  
bronchitis,  
Verminous  
pneumonia,  
"Husk"**

Mk 714; C2T 685;  
IM 664, 1705; BR-  
hb 476; BR 1246; Br  
810, 819, 236; DC  
69; Pic 80  
\*\*\*

- *Dictyocaulus viviparus*
- Yearling cattle >> adult
- Infected pastures
- Herd problem at pasture
- **Late Summer & Fall**
- High rainfall or irrigation
- Larvae in alveoli - block small airways

- **Coughing** (gradual onset)
- ↑ Respiratory rate
- Severity depends on # of larvae
- Can cause death

**Parasitic Pneumonia** (aspiration of eggs & larvae) + tracheitis & bronchitis (adults)

- Consolidation of caud. lung lobe
- **Marked coughing**
- Dyspnic, off feed, temp. elev., wt. loss
- SQ emphysema due to dyspnea
- May die if untreated
- **Self limiting** (slow recovery as eliminates adult worms)

• **CS - coughing**

- Auscultation - harsh sounds, w/ wheezes & crackles

• Larvae in feces

- **Baerman sedimentation** technique to look for larvae

• **Transtracheal wash** w/ eosinophils suggests larval migration

• **Direct life cycle**

- Adults lay eggs in trachea & bronchi
- Eggs hatch & larvae are coughed up
- Swallowed & passed in feces
- Larvae re-ingested
- Penetrate intestines
- Move by blood & lymph to caudal lungs, then to alveoli & bronchi
- Larvae in alveoli block small bronchi
- Adults cause inflammation in large airways
- Aspirated eggs & larvae cause consolidation of ventral part of caudal lobes

**Dictyocaulus, Summer/Fall**  
**CS: Coughing, Self limiting**  
**Dx: Baerman sedimentation**  
**Tx: Ivermectin**

**DDx**

- Fog fever (less coughing) (p 67)
- Farmer's lung (p 68)
- Bronchopneumonia (p 63)

**Aspiration pneumonia,  
Gangrenous/Foreign body/Medication/Lipid Inhalation pneumonia**

IM 650; BR-hb 164; BR 418; Br 668; C3T 59; DC 94  
\*\*\*

- Inhalation of foreign material
- Cause:
  - #1 careless drenching/ stomach tube milk or liquid medication
  - Pail-fed calves, pharyngeal paresis, necrobacillary laryngitis, anesthetized animals, parturient paresis, crude oil ingestion

- **Sudden death** (if "lots" inhaled)
- **Gangrenous bronchopneumonia**
- Depression
- Dyspnea, Polypnea
- Coughing
- ± Putrid breath

• **History (Hx), CS**

- Auscultation: crackles, wheezes, pleural friction rubs
- Postmortem: Consolidation of cranioventral lungs, necrosis

**DDx:**

- Bronchopneumonia (p 63)
- Septicemia (p 258)

• **Emergency**

- ABs - long term
- NSAIDs + corticosteroids IV

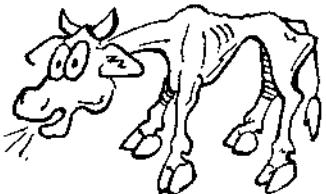

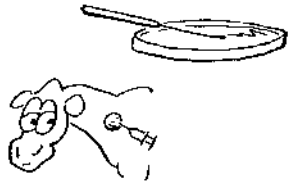

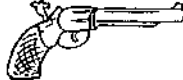

**Inhalation of FB - Careless drenching**  
**CS: Gangrenous bronchopneumonia, Sudden death**  
**Tx: Emergency - ABs, NSAIDs, Steroids • Px: Guarded**

**Prognosis: Guarded, but some can be saved**

# Tuberculosis

70

# RESPIRATORY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Tuberculosis</b></p> <p>MK 267, 369; IM 672; BR-hb 165, 327; BR 418, 830; BR 669; DC 474, 97; Derm 156; L 118</p> <p>★</p> 	<ul style="list-style-type: none"> <li>• <b>Mycobacterium:</b> acid fast bacilli</li> <li>• Pathogenesis                             <ul style="list-style-type: none"> <li>- 1° focus in lungs in man &amp; cattle</li> <li>- Drains to adjacent lymph nodes</li> <li>- Seldom heals, progresses slowly or rapidly</li> <li>- Localizes into tubercles (tumorlike granulomatous masses that tend to mineralize)</li> </ul> </li> <li>• Transm.: inhalation, ingestion of contaminated feces, milk                             <ul style="list-style-type: none"> <li>- M/ spread to udder - <b>Public health</b></li> </ul> </li> <li>• Main reservoirs: humans &amp; cattle</li> <li>• <b>Few infected herds in diverse areas of USA</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Chronic debilitating diz</b> <ul style="list-style-type: none"> <li>- Enlarged supf. lymph nodes m/b</li> <li>- Weakness, anorexia</li> <li>- <b>Dyspnea</b></li> <li>- <b>Chronic wasting &amp; Emaciation</b> <ul style="list-style-type: none"> <li>- Low grade fluctuating fever</li> <li>- Intermittent hacking cough</li> </ul> </li> </ul> </li> <li>• Acute rapid diz occasionally</li> </ul> <p style="text-align: center;"><b>PH</b> Reportable</p>	<ul style="list-style-type: none"> <li>• Dx only when advanced</li> <li>• <b>Tuberculin skin test</b> <ul style="list-style-type: none"> <li>- Inject tuberculin intradermally (PPD - purified-protein-derivative)</li> <li>- Inflam. &amp; swelling positive (delayed hypersensitivity reaction)</li> <li>- C-C test (comparative-cervical) <i>M. avium</i> &amp; <i>M. bovis</i> PPD tuberculin injected in separate sites on neck &amp; compared                             <ul style="list-style-type: none"> <li>• <i>M. paratuberculosis</i> m/ gives false positives</li> </ul> </li> </ul> </li> <li>• Culture organism to confirm 4-8 weeks</li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Notify authorities</b></li> <li>- Test &amp; slaughter</li> </ul>   <p><b>Prognosis: Grave</b></p>

## Vena caval thrombosis,

Metastatic pneumonia,  
Pulmonary thromboembolism,  
Embolic pulmonary aneurysm,  
Lung abscess

C2T566; IM654, BR-hb 164;  
BR 416; Br 416; DC 91, 62;  
GI 790; Pa 138

\*\*\*

- Common > 1% of necropsies (feedlots)
- Multifocal abscessation in lungs
  - Thromboembolism
  - Septic emboli arise from septic thrombi of caud. vena cava > cran. vena cava
- Cause of septic thrombi
  - #1 liver abscesses 2° to rumenitis
  - Mastitis, foot rot, jugular phlebitis
- Bact: *Fusobacterium necrophorum*, *Actinomyces pyogenes*, staph., strep, *E. coli*
- Feedlot cattle, most common (assoc. w/ rumenitis). Hi CHO diets - lactic acidosis, bact. penetrate rumen & pass to liver through portal vein
  - Abscess, w/ infiltrate caud. vena cava - thrombus
- Traumatic reticuloperitonitis
  - < 1 year old
  - 100% fatal!

- Respiratory distress (tachypnea [RR > 30/min], expiratory dyspnea, hyperpnea, coughing, frothy muzzle, SQ emphysema)
  - Widespread wheezes
  - Epistaxis
  - Hemoptysis (spitting blood), melena
- Anemia (hemic murmurs, pale "gums")
- Weight loss
- Thoracic pain
- Nonspecific (fever, depression, anorexia, rumen stasis, scant feces, ↓ milk production)
- Acute to chronic
- Chronic sequelae
  - Rt heart failure due to cor pulmonale
    - . Jugular pulse
    - . Brisket edema
  - Hepatomegaly
  - . Ascites
  - Chronic diarrhea

## CS: Resp., anemia, wheezing & hemoptysis - pathognomonic

- Lab:
  - Anemia
  - Neutrophilic leukocytosis
  - Hyperglobulinemia (freq.)
  - Liver: ↑ bilirubin & liver enzymes
- Rads: ↑ density to lungs, small densities
- Postmortem:
  - Abscess in caudal venal cava & adjacent liver, large, uncollapsed lungs, blood clots in airways, abscesses

Tx: Salvage

Prognosis:  
100% fatal

Prevention:

- Prevent rumenitis, slow adaptation to hi-energy food, ABs in feed to reduce liver abscesses

Rumenitis - Liver abscess - Caud. venal caval thrombus - Lung emboli

CS: Resp., Anemia, Widespread wheezes, Hemoptysis

Dx: CS pathognomonic, PM

Tx: Salvage • Px: 100% fatal

### DDx before hemoptysis

- Anaphylaxis (p 251)
- Acute resp. distress syndrome (p 67)
- Hypersensitivity pneumonia (p 68)
- Lungworms (p 69)
- Shipping fever (p 63)

## Haemophilus somnus

\*\*\*

- See pg Gen 254; Septicemic diz, ↑ frequency in pneumonia, Role in pneumonia not as well defined as CNS role, Calves - 4 weeks after entering feedlot
- CS: Resp. diz by itself or w/ CNS (cough, dyspnea, fever, pleuritis); TEME: CNS CS; Joint - lameness
- Dx: Calves w/ CNS, resp., & joint disease, Just respiratory signs difficult to Dx
- Tx: IV ABs (Naxcel®, Micolil®, oxytetracycline)
- Prevention: Bacterin of questionable value, Add aureomycin to feed

# Pleuritis

# RESPIRATORY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Pleuritis w/ pleural effusion</b></p> <p>Mk 707; IM 674, C3T 664; BR-hb 168; BR 422; Br 116; DC 97</p> <p>★★★</p>  <p><b>Inflam. &amp; Fluid in chest, CS, Not diz</b>  <b>CS: Pain, Dyspnea, Edema</b>  <b>Dx: CS, Hx, Auscul., Centesis, US, TTW</b>  <b>Tx: Drain, ABs, Analgesics, Support</b>  <b>Px: Grave - Poor</b></p>	<p>• <b>Acute 1° pleuritis rare in ruminants</b></p> <div style="border: 1px solid black; border-radius: 15px; padding: 10px; margin: 10px 0;"> <p><b>2° condition</b> almost always</p> <ul style="list-style-type: none"> <li>• Bronchopneumonia (p 63)</li> <li>• Hardware disease (p 38)</li> <li>• Liver abscesses (p 36)</li> <li>• Trauma (gunshot, broken ribs, perforation)</li> <li>• Contagious bovine pleuropneumonia (CBPP) (p 68)</li> <li>• Systemic conditions</li> <li>• Lung abscesses (p 71)</li> <li>• Uroperitoneum (p 96)</li> <li>• Rt. heart failure (p 76)</li> <li>• Hypoproteinemia (p 302)</li> <li>• Ruptured thoracic duct</li> <li>• Hemothorax (p 73)</li> <li>• SBE (sporadic bov. encephalomye.) **Pulmonary dysmaturity, Neonatal Resp. Stress Syndrome, Hyaline membrane diz**

IM 370

\*\*

- Parturition before lungs mature, insufficient surfactant produced
- Causes:
  - Spontaneous abortion
  - Induced parturition
  - Early cesarean section
- Pathophysiology: Surfactant appears in last trimester. Deficiency, resulting in incr. surface tension, fluid lining alveoli causes collapse, inability to expand lungs
  - Results in vicious cycle of hypoxia, pulmonary edema, atelectasis & lung damage w/ production of hyaline membrane

- M/b normal at birth then respiratory distress
- **Dyspnea**, inspiratory component
- Intercostal retraction
- ↑ HR & RR, cyanosis, gasping, open-mouthed breathing, depression, recumbency, hypothermia, unresponsiveness
- Sequela:
  - Septicemia

- **History** (physical signs of dysmaturity) (see box)
- Auscultation: harsh sounds, crackles
  - Machinery murmur from concurrent patent ductus arteriosus
- Lab: initial alkalosis followed by metab. acidosis (hypoxic anaerobic metab. = lactic acidosis)
- Rads: atelectasis - air bronchograms
- Postmortem:
  - Lung atelectasis, sunken, firm, dark red & sinks in water
  - Histo: Alveolar collapse & necrosis, hyaline membrane, edema, hemorrhage, low # of type II cells

**Physical signs of prematurity**

- Short, silky hair coat, low birth weight, short ears & tail

- **Emergency** - initiate before CS if suspect
- Stimulate surfactant formation
  - **Glucocorticoids or ACTH**
    - Thyroxine (T4) IM BID or TRH
    - Prolactin, pilocarpine
  - **Aminophylline**: bronchodilation & stimulate surfactant (IV TID)
  - Isoxaprine, lessen hypertension & bronchospasm, stimulates surfactant
  - Diuretics controversial
  - ABs for 2° septicemia
  - Oxygen therapy
  - Supportive nursing care
    - Whole milk by nasogastric tube, stim oral cavity w/ 5% Na bicarbonate 1st to close gastric tube
    - Couppage, posture drainage & airway suction

Prevention: Premature parturition anticipated: give TRH, ACTH or steroids to dam

**CS: Dyspnea, Immaturity**

**Dx: Hx, CS, Auscultation, Rads**

**Tx: Stim. surfactant, ABs, O<sub>2</sub>, Nursing**

**Failure of passive transfer**

- See Gen pg 246: **FPT: Born w/out immunoglobulins; Colostrum, #1 cause of death in 1st wk, Absorption 1st 12-18 hours of life**
- CS: Bacteremia, **Dyspnea, Diarrhea**, Anorexia, Depression, Weakness; Survivors: septic arthritis, meningitis, panophthalmitis
- Dx: **Can't be determined by PE** • Lab: Zn turbidity field test, **Refractometer - If failure, give colostrum**
- Tx: Tx clinical diz, **If less than 24 hours, feed colostrum. Over 24 hours - plasma or serum transfusion IV**
- Prevention: Feed colostrum automatically w/o test, **Make sure suckle in first 6 hours of life, 2 L colostrum in 1st 4 hours after birth**

**Hydrothorax & Hemothorax**

BR-hb 166; BR 419; IM 371

\*\*

- Accumulation of edematous transudate or whole blood in pleural cavity • Cause: hydrothorax congestive heart failure, BLV, ruptured thoracic duct (Chylothorax rare), Hemothorax due to trauma, Hemangiosarcoma; all causing compression atelectasis of ventr. lungs
- CS: **Dyspnea, NO fever, no pain or toxemia** • Dx: dullness on percussion, absence of breath signs, Thoracocentesis (sterile)
- Tx: Tx primary cause, If severe dyspnea - aspirate fluid (reaccumulates quickly), Fluid replacement in hemorrhage

**Pneumothorax**

IM 675; BR-hb 167; BR 420; DC 99

\*\*

- Uncommon in cattle
- Associated w/ pleural effusion
- Causes:
  - Thoracocentesis - small
  - Trauma: flail chest
  - Ruptured lung
- **Bovid - complete mediastinum - 1 side only**

- ± Dyspnea
- Abnormal respiratory effort
- **SQ emphysema**

- Seeing open chest
- Auscultation - absence of lung sounds dorsally
- Abnormal respiratory effort & SQ emphysema

**Uncommon, Complete mediastinum**

**CS: SQ emphysema**

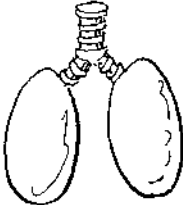

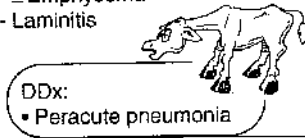

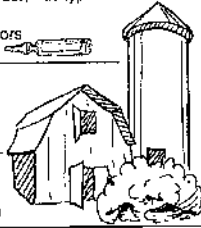

- **Cull/Salvage**
- Close chest wound, Sx
- Recreate negative pressure
- ABs (broad spectrum)

**Prognosis: Guarded**

# Heart

# CARDIOVASCULAR SYSTEM

## Congestive heart failure, CHF

Mk 11; BM&S 751; BR-hb 123; BR 329; Br 759; Pic 85

**Rt. sided CHF**, fluid backs out to the periphery

- (caud. & cran. vena cava)
- Edema: brisket, submandibular, limbs
- **Jugular pulsation, jugular distension** (pulse should only go 1/3rd of the way up the neck)
- **Ascites** (abd. fluid)
- Splitting of 2nd heart sound, pulmonic & aortic valves not closing synchronously due to dilation of rt. ventricle

**Lt. sided CHF**: fluid backs up into lungs

- Poor peripheral perfusions
- **Pulmonary edema w/ crackles** on auscultation
- **Respiratory dyspnea**
  - Prominent S3 (third heart sound)
  - Tachycardia
- **Pleural effusions**

### DDx:

- Rt. heart failure
- Bacterial endocarditis (p 81)
- Rt. AV insufficiency
- Cardiomyopathies (p 77)
- Pericarditis (p 76)
- Lt. heart failure
- Pleuritis or pleural effusions (p 72)
- Pulmonic valve stenosis
- Cardiac neoplasm (p 79)

### Fluid Backup:

- Right side - into body
- Left side - into lungs

Often see bilateral heart failure in cattle & horses

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
-----------	-------------	-----------------	-----------	-----------

## Traumatic reticulo-pericarditis "Hardware diz"

Mk 225, C3T 687; IM 532; Br 566, 126, 759; BM&S 752; G 508; BR-hb 137; BR 360; DC 44

\*\*\*

- Uncommon - cattle, rare - sm. rumin.
- **Indiscriminate eaters**
- **FB** (foreign bodies - wire, nail) through reticular wall & diaphragm into pericardial sac
- **Fluid into sac** (pericardial)
- Pleuritis
- **Heart failure due to compression**, sudden death due to acute hemorrhage or dysrhythmia

- Fever, ↑ HR, RR
- **Pain**, abducted elbows
- **Respiratory grunt**
- Constriction of Rt. side
- **Jugular pulse**
- **Extended jugular veins**
- **Ascites**, submandibular edema
- **Dehydration**
- Toxemic, arrhythmias, off feed
- GI stasis
- ↓ Milk prod.
- **CHF** (congestive heart failure)

### Other causes of CHF

- Pleuritis w/ pleural effusion (has distinctive signs)
- Hematogenous spread (rare)

- **CS**
- **Grunt test** (press up on ventrum)
- Auscultation (Pleural effusion)
  - **Muffled heart sounds**
  - Pericardial friction rubs
  - "Washing machine murmur" gas & fluid splashing sounds
- **Pericardiocentesis** (lt. 5th ICS at costochondral junction)
  - Fluid is odiferous
  - ↑ Protein & WBCs
  - Record volume drained off
- **Ultrasound** confirms pericardial effusion, note changes of heart movement, thickened myocardium (chronic)

- **Cull/slaughter**
- Tx unrewarding
- \$ If pregnant, or embryo transfer, 48 hrs to induce calving or to superovulate
- Pericardial drainage to incr. myocardial action:
- No furosemide
- Broad spectrum ABs (antibiotics)
- IV fluids, based on lab abnormalities

### Control

- Remove FB from eating area
- Bar magnets

### Prognosis (Px):

Grave, salvage only alternative, don't use ABs (antibiotics)

"Wire" -> Compression = Heart failure

CS: Jugular pulse, Pain, Dehydration

Dx: Grunt test, "Washing machine" murmur

Tx: Send to slaughter

## Cardiomyopathy, Dilatative cardiomyopathy

IM 527; C&T 352; BM&S 751;  
BR-hb 632; BR 1633; Br 145;  
DC 42; GI 790; Plc 85

\*\*\*

- **Dilatative** - only significant cardiomyopathy in large animals
- **Causes:**
  - Vit. E/Se deficiency
  - Ingestion of Lasalocid, Gossypol, *Cassia occidentalis*, *Phalaris* spp., monensin
  - Copper deficiency
  - Excessive molybdenum/sulfates (2° Cu defc)
  - Lympho- or fibrosarcoma
  - Abomasal displacement assoc. w/ cardiomyopathy

- **Cardiac failure**
  - **Peripheral edema** (rt.)
  - **Jugular venous pulse** or distention (rt.)
  - **Resp. distress** (lt. heart)
    - . Tachypnea
    - . **Dyspnea** (pleural effusion)
    - . Bloody froth in nostrils
- **Nonspecific signs**
  - Diarrhea, Anorexia, Syncope
  - Exercise intolerance
  - ↓ Milk production
- **Sudden death**

- **CS**
  - Auscultation abnormal
    - . Tachycardia
    - . Gallop rhythm
    - . **Muffled heart sounds**
    - . Cardiac dysrhythmia, murmurs 2° to dilatation
- **Postmortem (PM):**
  - Grossly enlarged heart
  - Heart failure signs
    - . Gen. edema
    - . Congestion of liver, lungs & spleen
    - . Pleural effusion

- **Salvage**
  - \$ Digoxin (inotropic agent)
  - Diuretics (Furosemide)
  - Rest
  - Removal of pleural or abd. fluid

**Prognosis (Px):** Poor

**Prevention:** see prevention to causative agents on following page

**DDx:**

**CALF:**

- Congenital heart defects (p 79)
- Cor pulmonale
- Nutritional: myodegen. (p 78)

**ADULT:**

- Bacterial endocarditis (p 81)
- Thoracic abscesses (p 71)
- Cardiac neoplasia (p 79)
- Pericarditis (p 76)
- Pleuritis (p 72)
- Diaphragmatic hernia (p 460)

**Lg. Animals = Dilatative**  
**CS: Cardiac failure**  
**Dx: Auscultation, PM**  
**Tx: salvage • Px: Poor**

**Congenital cardiomyopathy:**  
• Polled Hereford - Curly hair coat - Rare

**Haemophilus somnus** (See Gen pg 254) • Calves, Feedlot, Septicemic diz: TEME, Lungs, Joint, Repro & Heart abscesses, Infertility, Conjunctivitis,

- **CS: CNS, Resp, Joint, Myocardial abscesses, Fever & Resp. distress & depression from left heart failure; or Found dead**

## Myocarditis

IM 527; C&T 546; G 506; BR-hb 124; BR 332, 350; DC 40

★★

Uncommon

- **Uncommon**
- **Inflammation of myocardial wall**
  - Bacteria (Staph., Strep., Clostridium, Mycobacterium)
  - Virus (foot & mouth disease)
  - Parasite (toxoplasmosis, sarcocystis, cysticercosis)
- Thromboembolic diz (rare in cattle)
- 2° - bacteremia, septicemia, pericarditis, endocarditis

- **Variable or unnoticed**
  - 1° diz may mask vague heart signs (e.g., mastitis)
  - Tachycardia
  - Febrile
  - CHF (peripheral edema)
  - Sudden death
  - M/ lead to idiopathic dilated cardiomyopathy

- **Rarely diagnosed**, mild, vague signs of heart involvement
- 1° cause masks heart signs
- **Postmortem:**
  - M/b no gross lesions

- **Treat 1° agent**
- **Control complications:** CHF, Shock, Dysrhythmias

**Prognosis:**  
• Good, if no CHF  
• Guarded to poor with CHF

- Prevention**
- Vaccination
  - Parasite control

**DDx:**

- Masked heart signs
- Septicemia
- Resp. diz

**Heart signs**

- Endocarditis (p 81)
- Cardiac neoplasia (p 79)
- CHF (p 76)
- Cardiomyopathy (p 77)

# Myocardial Diz

# CARDIOVASCULAR SYSTEM

## Congenital heart defects

Mk 34, C3T 95, IM 512, 1554; BR-hb 138, 89, 633; BR 361,1634; BR 144; Pic 15

\*\*\*

- **#1 - Ventricular Septal Defects (VSD)**
  - Holosystolic murmur, blood from left to right; murmur in area of AV valves. More blood in rt. ventricle so more through pulmonary trunk, resulting in a relative stenosis & systolic stenotic murmur
- **PDA (patent ductus arteriosus):** continuous "machinery murmur" (left 3-4th ICS, shoulder level)
- **Tetralogy of Fallot** (overriding aorta, ventricular septal defect, pulmonic stenosis & hypertrophy of rt. ventricle); loud holosystolic murmur w/ palpable thrill (left 4-6th ICS)
- **Atrial septal defects (ASD):** most commonly patent foramen ovale, common in calves, usu. asymptomatic bec. different pressures in atria cause functional closure even though its not an anatomical closure
- **Ventricular hypoplasia:** m/b present w/ other defects & usually assoc. w/ early death
- **Persistent rt. aortic arch:** forms a ring around the esophagus with the pulmonary trunk, ligamentum arteriosum & base of heart • Sequela: megaesophagus
- **Ectopic cordis cervicalis:** relatively common in cattle, heart usually in neck region, some in pectoral region or abdomen; assoc. w/ other defects • Px: Poor for productive life, but m/ live up to 1 yr
- **Eisenmenger's complex:** VSD, overriding aorta, dilated pulmonary trunk; gallop rhythm

### CS:

- Poor appetite
- Reduced growth rate
- Dyspnea
- Tachycardia
- Cyanosis

### Dx:

- On initial exam
- Listen on both sides of animal, not just left
- M/b incidental finding
- No CS

### Tx:

- Slaughter if doing poorly

## Lymphosarcoma cardiomyopathy, Enzootic

### lymphosarcoma

Mk 391; C3T 609; BM&S 638; IM 536, Br 530; BR 365; DC 40; Pic 208

\*\*

- See Gen, pg 269
- Myocardial damage (rt. atrium) also uterus, lymph nodes & abomasum
- BLV (bovine leukemia virus)
- Adult cattle
- AV valves, then whole heart
- Rt. AV (tricuspid) insufficiency

**BLV - Virus, Right atrium**

**CS: Cardiomyopathy, Edema, Jugular pulse**

**Dx: Difficult**

**Tx: None; Cull all BLV + • Px: Grave**

## Dilated cardiomyopathies

- Brisket edema
- Jugular pulse

### DDx:

- Reticulopericarditis (p 76)
- Bact. endocarditis (p 81)
- Cu deficiency (p 89)

- Dx difficult
- Ultrasound
- Lymphosarcoma elsewhere
- Cardiac arrhythmias
- Leukemia in only 1/3rd of clinical cases
- Biopsy/necropsy definitive Dx
- BLV titers not diagnostic, indicate exposure
- Negative titer rules out

## No treatment

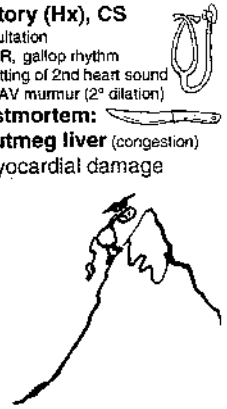

**Prognosis (Px): Grave**

**Eradication of BLV infection is feasible**  
- Id & remove all BLV-positive animals

**Cardiac tumors:** Rare in large animals, 1" or 2" to tumors of lungs, pleura, lymph nodes or diaphragm. BLV - lymphosarcoma, thymic lymphosarcoma; No Tx, test for BLV positive animals; death expected in 6 months

## Heart

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>High mountain disease,</b> <b>Brisket edema,</b> <b>High altitude diz,</b> <b>Pulmonary hypertensive heart disease</b> Mk 632, IM 525; BR-hb 134, 533; BR 353, 1457; BM&S 764; DC 46, 54 *** 	<ul style="list-style-type: none"> <li>• <b>Chronic hypoxia of high altitude</b></li> <li>- Pulmonary vasoconstriction &amp; hypertension</li> <li>- Right ventricle overworked, chronic pressure overload</li> <li>- Enlarged heart, either hypertrophy or dilatation</li> <li>- Leads to <b>CHF</b> (congestive heart failure)</li> <li>• Stress initiates (cold weather)</li> <li>• <b>Moved &gt; 6000 feet</b></li> <li>• Calves &gt;&gt; adults</li> <li>• Genetic disposition, inline assoc. ## Bacterial endocarditis

**Vegetative endocarditis, Endocardial Disease**  
Mk 49, C3T 687; IM 520; BM&S 756; Br 581, 128; BR-hb 136; BR 357; DC 42

★★

- **Bacteria** - *Corynebacterium pyogenes*, Strep., Erysipelothrix, Actinomyces, E. coli.
- Subclinical bacteremia
- **Septic thrombus** - 2° to pyemia, mastitis or prostatitis
- Iatrogenic jugular sticks
- **Vegetation on valves**, layers of fibrin, blood cells, bacteria & necrotic tissue, most commonly affect endocardium of valves
- Determine if during systole (AV valves) or diastole (semilunar valves)

**Septic thrombus, iatrogenic**

**CS: CHF - Edema, Jugular pulse**

**Dx: CS, Murmur, US, Culture, Vegetation**

**Tx: Salvage • Px: Grave**

- **Weight loss, hypophagia**
- ↓ Milk production
- **CHF signs**
- **Edema, ascites, milk vein distention**
- **Systolic jugular pulse**
- **Intermittent fever**
- 2° organ systems
- Pyelonephritis
- **Pneumonia** (adventitious sounds, ↓ bronchial tones)

- **History, CS**
- **Systolic murmur - Rt. AV**
- **Ultrasound**
- **Positive blood culture**
- **Lab:**
- Leukocytosis
- **Positive blood culture**
- **Postmortem:**
- **Vegetation on valves**

### DDx:

- Endocarditis of other causes
- Degeneration of valves
- Viral
- Inflammation
- Trauma
- Rupture of rt. chordae tendinae
- Brisket edema (p 80)
- Cardiomyopathies (p 77)

- **Salvage**
- \$ Expensive pregnant cows
- AB (antibiotic) empirical\* (penicillin)
- Long term treatment - mos. (3)
- Fibrous tissue of vegetation m/ protect bacteria from ABs
- Chronic poor doers
- Drug residue in body & milk

### Prognosis:

#### • Grave

\* Empirical: from your vast experience

**Vegetation on valves**, stops the valves from completely closing, blood backs up through the valves - murmur of insufficiency [leaky]. **Cattle:** right AV valve most common, blood backs into rt. atrium; **Other species:** aortic or lt. AV (bicuspid) valve

## Atrial fibrillation

Mk 45, C3T 689; IM 541; BM&S 759; BR-hb 129; BR 347; DC 47

\*

- **Assoc. w/ GI diz** 75 - 85% of the time
- Also foot rot & pneumonia
- **Usually no underlying heart diz** (If underlying heart diz - Px worse)
- **Atriocardial diz**
- **Autonomic imbalance**
- **Rapid, uncoordinated atrial contractions, resulting in insufficient filling of ventricles**

**Assoc. w/ GI diz, Heart OK**

**CS: GI diz, Anorexia, ↓ Milk production**

**Dx: GI diz, Rapid HR, F waves, No P waves**

**Tx: Tx GI - Resolves**

- **GI diz**
- Anorexia
- ↓ Milk production

**Quinidine sulfate IV** (not oral, diluted in saline or LR) until conversion

- IV fluids in other jugular vein simultaneously
- Side effects during administration
  - Diarrhea & depression, continue treatment
  - Monitored with ECG while admin.
  - If do not convert, grave Px

- **Underlying GI diz**
- **Ascultation:**
- Rapid & disorganized heart sounds

- **ECG:**
- **F (fibrillation) waves replace P waves**

- Irregular P-R interval
- QRS irregularly spaced
- **Underlying electrolyte abnormalities**
- Metabolic alkalosis, hypochloride, etc.

- **Tx underlying GI diz**
- **Correct electrolyte imbalance**
- **Tachycardia should resolve**

- If fibrillations continue after 5 days:

- **Quinidine sulfate IV** (see box)
- If high heart rates (> 120 per min, rare)
  - **Digoxin** to lower heart rate
  - Then quinidine

### Prognosis:

- **Good** if not underlying heart diz or chronic GI diz
- **Grave** if no conversion

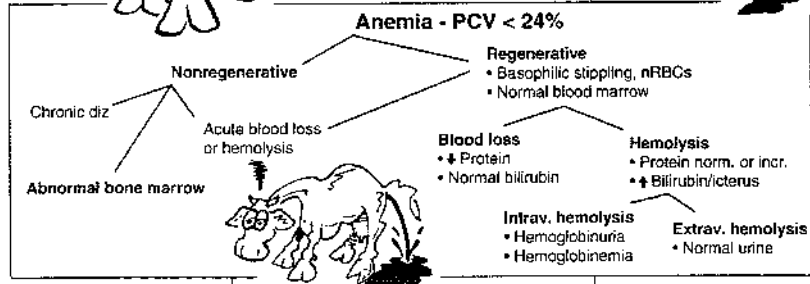

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Anemia</b> IM 423; 372; C3T 693; C2T 689; BR-hb 148; BR 384; DC 54; S-O 679 ★★★	<ul style="list-style-type: none"> <li>• <b>↓ O<sub>2</sub>-carrying capacity of blood</b></li> <li>• Pathophysiology of causes                             <ol style="list-style-type: none"> <li>1. <b>Blood loss</b></li> <li>2. <b>Hemolysis</b> (incr. RBC destruction)</li> <li>3. <b>Inadequate erythrocyte production</b> (bone marrow)</li> </ol> </li> <li>• Types                             <ul style="list-style-type: none"> <li>- <b>Regenerative anemias</b> <ul style="list-style-type: none"> <li>. Blood loss or hemolysis - bone marrow responds by incr. erythropoiesis</li> </ul> </li> <li>- <b>Nonregenerative</b> - inadequate RBC prod., bone marrow problem</li> </ul> </li> </ul>	<b>CS due to inadequate O<sub>2</sub> to body tissue</b> <ul style="list-style-type: none"> <li>• <b>↑ HR</b> (tachycardia)</li> <li>• <b>↑ RR</b> (tachypnea)</li> <li>• <b>Exercise intolerance</b> (tiring)</li> <li>• <b>Depression</b></li> <li>• <b>Pale mucous membranes</b></li> </ul> 	<ul style="list-style-type: none"> <li>• <b>History (Hx): diet &amp; access to pasture</b> <ul style="list-style-type: none"> <li>- Other herd members affected or systemically ill</li> <li>- Immune status &amp; exposure</li> </ul> </li> <li>• <b>PE (physical exam):</b> <ul style="list-style-type: none"> <li>- Color of mucous membr. (Icterus is rare in cattle, except in assoc. w/ hemolysis)</li> <li>- Fever: m/b sign of hemolysis or systemic diz</li> <li>- Hemoglobinuria caused by most hemolytic anemias, except anaplasmosis</li> <li>- Onion breath</li> </ul> </li> <li>• <b>CBC:</b> <ul style="list-style-type: none"> <li>- <b>PCV reduced &lt; 24%</b> </li> <li>- <b>Regenerative signs: blood loss or hemolysis</b> w/ normal bone marrow                                     <ul style="list-style-type: none"> <li>. Basophilic stippling, anisocytosis, polychromasia, Howell-Jolly bodies, nucleated RBCs</li> </ul> </li> <li>- <b>Nonregenerative signs: abnormal bone marrow</b>, acute blood loss or acute hemolysis &lt; 4 days</li> </ul> </li> </ul>	Treat underlying cause

• MCV (mean corpuscular volume): reflects the size of RBCs

$$MCV (fl) = \frac{PCV \times 10}{RBC \text{ count (millions/fl)}}$$

- **↑ MCV** indicates regen. anemia (immature RBCs larger than mature RBCs)
- **↓ MCV** (microcytosis) indicates iron deficiency

- **↑ Hb, MCH &/or MCHC w/ low PCV:** intravascular hemolysis
- **Basophilic stippling w/o other regen. signs:** lead poisoning
- **Heinz bodies:** onions or Brassica plants, postparturient hemoglobinuria
- **Agglutination** suggests immune-mediated anemia
  - . **Coombs' test**, dilution test, RBC fragility test
- **Plasma protein changes:**
  - Hypoproteinemia + anemia => blood loss
  - Hyperproteinemia, hyperglobulinemia &/or hyperfibrinogen = chronic inflam. diz
- **Urine analysis (dipstick) for occult blood:**
  - If positive do sedimentation exam to rule out hematuria
  - Hemoglobin assoc w/ pink plasma + occult blood w/o urinary sedimentary abnormalities
  - Myoglobinuria (myopathy) assoc w/ clear plasma + RBCs
- **Occult blood in feces:**
  - Melena: GI blood loss (gastric ulcers)
- **Bone marrow analysis:** necessary if no peripheral signs of regeneration

# DDx - Anemia (IM: 477; CST 895, 896) • See DDx pg 300

**Bleeding disorder of Simmental cattle:** Rare; Prolonged episodes of bleeding, Spontaneous epistaxis, Superficial hematomas

Disorders of hemostasis (IM 1202; CST 698; BR 370)

- Acquired: hepatic failure, rodenticides (dicoumerol), moldy sweet clover poisoning, DIC • Dx: ↑ PTT & PT times
- Congenital: hereditary defc - coagulation factor VIII (Hereford cattle), factor XI (Holstein cattle) • Dx: ↑ PTT time

**DIC,**  
Disseminated  
intravascular  
coagulation,  
Consumptive  
coagulopathy,  
Intravascular coagulation  
fibrinolysis

Mk 24; C3T 698; IM 1207;  
BR-hb 144; BR 372;  
Br 563; DC 60

\*\*\*

- Never a 1° disease entity
- Dizziness causing vasculitis activate platelets & clotting mechanism
- Septic processes (salmonellosis, metritis)
- Neoplasia
- Acute GI disorders (strangulation, acute enteritis, protein losing enteropathy, emboli)
- Hemolytic uremic syndrome
- Hemolytic anemia
- Spectrum from diffuse thrombosis to ischemic organ failure to severe hemorrhagic diathesis
- RBCs are damaged passing through damaged arterioles & removed by endoreticular system
- Peracute diz in Gr. Britain: *Pasteurella multocida*, CS: Septicemia & high mortality
- USA probably free

- Variable - dep. on 1° diz
- Rarely overt hemorrhage
- Thrombosis & ischemic organ failure
- CNS - microvascular thrombosis
  - Delirium, convulsions, coma
- Petechial or ecchymotic hemorrhages (depletion of clotting factors)
  - Life threatening hemorrhage very rare

- Sequelae:
  - Renal failure - common
  - Oliguria, azotemia (excess urea or other nitrogenous bodies in blood, BUN)
  - Depression & ileus

- Systemic CS
- Lab:
  - No test for definitive Dx, Findings often NOT helpful
  - Strongly suggestive
    - Thrombocytopenia
    - < 100,000/ml platelets
    - suspect DIC
    - Mild to moderate prolongation of PT &/ or APTT time
    - Occult blood in feces

**DDx:**

- Septicemia
- Warfarin toxicosis (pg 214)
- Moldy sweet clover toxicosis (pg 229)
- Inherited coagulation abnormalities

- Treat 1° disorder
- Supportive Tx to combat shock & maintain tissue perfusion
  - IV fluids
  - ABs for septic conditions
  - Banamine® (flunixin meglumine) (IV, q8h) for endotoxins
  - Corticosteroids not indicated, m/ worsen
- Heparin - highly controversial:

**2° Entity; Activated platelets & Clotting**

CS: Thrombosis/Organ failure - CNS

Dx: Difficult, Platelets < 100,000

Tx: Tx 1° cause, Supportive

**Thrombo-**  
**cytopenia**

Mk 56, 428; C3T 698; IM 1204; BR-hb 150; BR 372

- Platelet count < 100,000
- Premature cell destruction or
- Impaired production

- Causes
  - Sepsis due to DIC
  - Immune-mediated drug reaction
  - Neoplasia
  - Isoimmunization of newborn calves
  - Bracken fern poisoning

- Vary w/ underlying diz process
- Hemorrhagic diathesis
  - Petechial hemorrhages
  - Oral, ocular, nasal mucosa
  - Epistaxis
  - Prolonged bleeding from wounds or injection sites
  - Hematoma formation w/ trauma (< 40,000  $\mu$ l)

- History, CS - Rule out DIC
- Lab
  - Thrombocytopenia (< 100,000 platelets)
  - Prolonged bleeding time & abnormal clot retraction
  - No effect on clotting time or plasma fibrinogen
  - Response to Tx supports Dx

CS: Bleeding

Dx: Platelets < 100,000

Tx: Steroids

- Unexplained case
  - Stop all drugs, if Rx necessary replace w/ most dissimilar Rx
  - Steroids: Dexamethasone, Prednisolone
  - Blood transfusion

# Hemorrhage

# CARDIOVASCULAR SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment - Prognosis
-----------	-------------	-----------------	-----------	-----------------------

## Moldy sweet clover & Anticoagulants (Warfarin, coumarins)

- See Tox pg 229, 214
- CS: Hemorrhagic diathesis
- Dx: Hx (exposure), Hemorrhages, Prolonged PT, Anemia, Hypoproteinemia
- Tx: Remove source, Remove plants, Vit. K1, Fresh plasma, Whole blood transfusion

## Abdominal ulcers

\*\*\*

- See GI pg 31; Stress, Feed, Lymphosarcoma
- CS: Variable (Abdominal pain, Melena, Peritonitis)
- Dx: Fecal occult blood, Anemia, Exploratory
- Tx: Salvage, Tx ulcers (Fluids, ABs, Antacids, Sx)

Sweet Clover

## NONREGENERATIVE ANEMIAS

### Bracken Fern toxicosis

- See Tox, pg 228
- *Pteridium*
- Not very common
- Western USA
- Chronic ingestion of plant (must ingest large amounts for 2-3 weeks or longer, cumulative)
- Bone marrow aplasia
  - Pancytopenia (complete bone marrow depression, all precursors destroyed)
  - Clotting abnormality

Bone marrow damage, Pancytopenia

CS: Bleeding

Dx: "No platelets" < 40,000

Tx: None, Batyl alcohol • Px: Grave - Die

- Hemorrhagic syndrome due to platelet loss
  - Bleeding from body orifices & into body cavities
  - Melena (lost of blood in feces)
  - Epistaxis
  - Mucosal petechiation
  - Hematuria
  - Hyphema (blood in anterior eye)
  - Blood from med. canthus
- Temperature elevation
- Chronic infec. of multiple systems due to no WBCs
  - Bacteremia
- Death 1-3 days after CS

- History (bracken fern area), CS
- Lab
  - Platelet < 40,000/ml (200,000 norm.)
  - Profound leukopenia (neutropenia)
  - Nonregenerative anemia less severe than thrombocytopenia due to longer half life of RBC

#### DDx:

- Leptospirosis (p 257)
- Anaplasmosis (p 92)
- Bacillary hemoglobinuria (p 90)
- *Crotalaria* spp
- Sweet clover (p 229)
- Warfarin poisoning (p 214)

- Usually too late
- Batyl alcohol as a bone marrow stimulant, but rarely works

#### Prognosis:

- Grave - platelets < 50,000, WBCs < 2000/ $\mu$ l usually die

#### Prevention:

- Remove bracken fern

Bracken Fern

## Iron defc anemia

C3T 700; IM 1232; BR-hb 148; BR 385

- **Commonly assoc w/ chronic blood loss:** parasitism, bleeding ulcers, GI lesions or hemostatic defects, modest anemia in veal calves raised on milk diets, otherwise dietary defc seldom causes, even in neonates
- **CS:** often asymptomatic because adapt to slowly progressing anemia, cows m/ stand & graze w/ hematocrit of 5%
- **Dx:** PCV < 24%, microcytic, hypochromic anemia
- **Tx:** correct chronic blood loss; iron oral supplementation or feed additives

## Chronic inflam. diz

C3T 695; IM 1233; BR 385; DC 55

- **Cause:** chronic internal or cutan. infec., immune-mediated processes resulting in chronic inflam., active malignant neoplasia, traumatic injuries or fractures
- **Pathogenesis:** sequestration of iron in liver & bone
- **CS & Dx:** CS of 1° diz, Mild to moderate nonregenerative anemia
- **Tx:** Tx primary disease process

DDx

- Liver abscess (p 36)
- Chronic abscess
- Chronic BVD (p 253)
- Johne's diz (p 23)
- Chronic pneumonia (p 62)
- Chronic renal diz
- Bracken fern toxicosis (p 228)
- Neoplasia (p 268)

**Internal parasites** (IM 1234) • Trichostrongylus, due to bone marrow suppression

**Leptospirosis** (DC 55) • See Gen pg 257

## Lymphosarcoma

- See Gen pg 269: Anemia m/b present w/ GI hemorrhage (microcytic, hypochromic), nonregenerative anemia

## 2° to Organ dysfunction (DC 55)

- Nonregenerative anemia (mild to moderate); chronic endocrine, hepatic, renal or GI diz

## Cobalt/Vit B12 defc (Folic acid)

C3T 701; IM 1233, 908; BR-hb 149, 527; BR 385, 1374; Br 267; DC 509; GI 791

- Cobalt needed for Vit B12, Ruminants meet Vit B12 needs if sufficient Co; Deficiency = inefficient metabolism of propionate
- **CS:** Nonspecific: Decr growth, Weight loss, Unthrifty, Pale mucous membranes, Diarrhea, Lacrimation, Anorexia
- **Dx:** Hx, CS, Anemia (normocytic normochromic), FIGLU (formiminoglutamic acid) level in urine (0.08-0.2 µmol/ml) metabolite
- **Tx:** Vit B12 injection (2-3000 µg weekly)
- **Prevention:** Salt mineral mixes, top dressing of pasture, rumen pellets

## Lead toxicity

- See NS pg 152, Cattle indiscriminate eaters (crankase oil), Interferes w/ heme synthesis (-SH enzymes) shortened RBC lifespan, cerebellar edema
- **CS:** CNS (bellowing, blind, maniacal, convulsions, ataxia), GI
- **Dx:** > 0.3 ppm in blood, nonregenerative anemia
- **Tx:** EDTA, Thiamine, Supportive, Rumenotomy

## Hemolytic Anemia

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Post-parturient hemoglobinuria</b></p> <p><b>"Red water diz"</b></p> <p>Mk 455, C3T 323; IM 1229; BR-nb 148, 524, 542; BR :362, 1428; DC 55</p> <p><b>**</b></p> 	<ul style="list-style-type: none"> <li>• <b>Uncommon</b>, 1-2 cows in a herd, minor economic losses</li> <li>• <b>High producing dairy cattle</b></li> <li>- &lt; 6 wks after calving</li> <li>• <b>Cause unknown</b>, predisposing factors:             <ul style="list-style-type: none"> <li>• <b>#1 Hypophosphatemia</b> <ul style="list-style-type: none"> <li>• Low intake in low phosphate soils after a drought - lush pastures, housed cows in summer on pasture or winter for pasture cows</li> <li>• Phosphorus drainage into milk at early lactation</li> </ul> </li> <li>• Eating hemolytic agents - turnips &amp; beet pulp or cruciferous plants (rape &amp; kale), m/n not relate to parturition (see below)</li> <li>• Copper defc from molybdenum fertilizer (New Zealand) (see below)</li> </ul> </li> <li>• <b>Intravascular hemolysis</b>, low P             <ul style="list-style-type: none"> <li>- Depressed glycolysis &amp; ATP + incr. fragility to RBCs (spherical - rupture)</li> </ul> </li> </ul> <p style="font-size: 2em; text-align: center;"><b>P</b></p>	<ul style="list-style-type: none"> <li>• <b>Acute 3-5 ds</b> - death</li> <li>• <b>Weakness &amp; staggering</b></li> <li>• <b>↓ Milk production</b></li> <li>• <b>Red-brown to black urine</b></li> <li>• <b>Inappetant m/b</b></li> <li>• <b>Dehydrated</b></li> <li>• <b>Pale mucous membranes</b>, anemia</li> <li>• <b>↑ HR/RR</b>, afebrile usually</li> <li>• Photosensitization, gangrene, slaughtering of teats, tail, digits, diarrhea occasionally</li> <li>• Pica, osteomalacia, lameness, predisposition to botulism, GI obstruction m/b</li> <li>• <b>Icterus</b> if lives long enough</li> <li>• <b>Survivors</b> - slow recovery 3-8 wks</li> </ul> <p><b>DDx:</b></p> <ul style="list-style-type: none"> <li>• Chronic Cu toxicity (p 88)</li> <li>• Acute Leptospirosis (1° seen in calves, rare) (p 257)</li> <li>• Bacillary hemoglobinuria (p 90)</li> <li>• RBC parasites (anaplasmosis &amp; babesia) (p 92)</li> <li>• Rape &amp; kale toxicity (p 233)</li> <li>• Monensin toxicity (p 78)</li> <li>• Blood transfusion reaction</li> <li>• Blue green algae (p 237)</li> <li>• Plithomyces toxicity</li> <li>• Toxic drugs (phenothiazine, methylene blue)</li> <li>• Bracken fern toxicity (p 228)</li> <li>• Urolithiasis</li> </ul>	<ul style="list-style-type: none"> <li>• <b>History, CS - hemolysis</b></li> <li>• <b>Lab:</b> <ul style="list-style-type: none"> <li>- <b>Regenerative anemia</b> (if survives)               <ul style="list-style-type: none"> <li>• Basophilic stippling, Heinz bodies, Nucleated RBCs, anisocytosis &amp; polychromasia</li> </ul> </li> <li>- <b>Hemoglobinemia</b> (&lt; 8 g/dl)</li> <li>- <b>Hemoglobinuria</b> (differentiate from myoglobinuria) (Labstix®), absence of RBCs in urine confirms</li> <li>- <b>Low blood P (hypophosphatemia)</b> (&lt; 1 mg/dl, norm. 4-7)</li> <li>- <b>Nonfatal cases - ketosis</b></li> </ul> </li> <li>• <b>Postmortem:</b> <ul style="list-style-type: none"> <li>- Icteric carcass </li> <li>- Pale, swollen liver, centrilobular necrosis</li> <li>- Hemoglobinuric nephrosis</li> <li>- Discolored urine in bladder</li> </ul> </li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Supportive, cause unknown</b></li> <li>• <b>IV fluids</b> (add glucose)</li> <li>• <b>Blood transfusions</b></li> <li>• <b>Remove predisposing factors</b></li> <li>• <b>Phosphorus</b> IV &amp; SQ 60 g Na acidic phosphate in 300 ml of sterile saline, also drench w/ 30 g Na phosphate or 150 g of bone meal or feed 100 g/d of dicalcium phosphate (DCP) </li> <li>• <b>Bone meal in feed</b> <ul style="list-style-type: none"> <li>• Methylene blue IV (antioxidant)</li> <li>• Steroids (20 mg Dexamethasone IM)</li> <li>• Oral ketosis Tx</li> <li>• Copper glycinate SQ (copper defc areas)</li> <li>• Remove cruciform plants, feed quality hay</li> <li>• Severely affected don't respond</li> <li>• Marginally affected &amp; eating - bonemeal over long period of time</li> </ul> </li> </ul> <p><b>Prevention:</b></p> <ul style="list-style-type: none"> <li>• <b>Nutrient analysis of feedstuff (P, Cu, Se)</b></li> <li>• <b>P supplementation</b> in defc. areas             <ul style="list-style-type: none"> <li>- Bone meal or Na acid phosphate or DCP or bone meal licks</li> <li>- Copper glycinate SQ mo before parturition or 20 g oxidized wire needles in copper defc areas</li> <li>• Limit cruciferous plants &lt; 1.5 kg/d &amp; restrict turnip &amp; beet pulp in 1st 2 months of lactation</li> </ul> </li> </ul>
<p><b>P defc, Hi prod. dairy after calving, Hemolysis</b></p> <p><b>CS: Anemia, Red urine, Icterus, Death - 5 days</b></p> <p><b>Dx: Hx, CS, Regen. anemia, Hemoglobinuria, PM</b></p> <p><b>Tx: Phosphorus</b></p>				
<p><b>Copper toxicity</b></p> <p><b>*</b></p> 	<ul style="list-style-type: none"> <li>• <b>See Tox pg 203</b>; Rare in cattle; 1° of sheep; Chronic copper over time, massive amounts of copper from liver (stress?) = Severe intravascular hemolysis</li> <li>• <b>CS:</b> Acute intravascular hemolysis - Icterus, Dark urine, Excessive thirst, Weak, Incr. HR, RR, Painful back (nephrosis)</li> <li>• <b>Dx:</b> PM gunshot kidneys, Hx, CS, Red plasma, Hb-/methemoglobinuria, Heinz bodies in RBCs, Blood &amp; kidney levels of Cu.</li> <li>• <b>Tx:</b> Most die if CS, Tx intensive, Best Tx is prevention (correct Mo/Cu ratio in diet)</li> <li>• <b>Px:</b> Grave, despite therapy. Usually not treated</li> </ul>			

## Copper defc, Molybdenum toxicity \*\*\*

### Hypocuprosis, SMC0 poisoning

Mk 1197; C3& 397, 324; IM 904, 1232; BR-hb 148, 52B, 56B; BR 1493, 1379; Br 263.

218; BM&S 526; DC 250; 508t; L410; Pic 31

- Copper - important for Hb (hemoglobin) & osteoblasts
- 1° Deficiency - low dietary
  - Milk low in Cu
- 2° Assoc w/ excess molybdenum, Zn, Iron or Sulfate
- S methyl-L-cystein sulfoxide
- Calves > adult; Cattle > sheep

1° Cu defc, 2° Molybdenum/Sulfate excess

CS: Poor growth, Anemia, Loss of hair color

Tx: Copper injection

- Poor weight gain
- Pale mucous membranes
- Bone fragility (spontaneous fxns)
- Watery diarrhea
- Myocardial fibrosis
- Phytitis (enlarged ends to leg bones)
- Loss of hair color (cattle)
- Congenital rickets

- Swayback or enzootic ataxia (lambs)
- CNS - demyelination - incoordination, blindness & death

• CS, History

### DDx:

- Poor wt. gain
  - Parasitism (p 54)
  - Trace mineral defc (Se, Cobalt)
  - Nutritional (p 78)
  - Johne's disease (p 23)
- Anemia
  - Vit E/Se deficiency (p 78)
  - Ingestion (Lasalocid, gossypol, Cassia occidentalis, Phalaris spp.)
  - Lympho- or fibrosarcoma (p 268)

• Copper (injectable or dietary)

- 1 injection for 1° defc
- Repeat inject. 2° defc every 4-8 wks
- Cu toxicity
  - Sheep more susceptible

### Prevention

- Cu supplementation

### Prognosis

- Guarded to good

## Heinz body hemolytic anemia, Toxicigenic hemolytic anemia,

Kale, Beet pulp, Rye grass, Onion toxicity

C3T 323, 350; IM 1227, 1888; Br 613; P 278; Br-hb 148; BR 1566; DC 55; Tox 397

★★

- Oxidizing agents
  - Plants:
    - . Wild or domestic onions
    - . Brassica family/cruciferous plants (turnips, rape, kale)
    - . Rye grass (*Secale cereale*)
    - . Selenium defc pastures in Florida
  - Copper defc (see above) N. Zealand
  - Phenothiazine (dewormer rarely used), methylene blue
  - Hypophosphatemia (see above)
- Heinz bodies formed by oxidative denaturing of hemoglobin in RBC (prot. clumps in RBCs)
- Spleen removes RBCs (reticuloendothelial system) - RBCs w/ Heinz bodies less deformable, oxidized & broken down (extravasc. hemolysis)
  - . Also change tonicity - intravascular hemolysis

- Weakness, depression
- Anorexia
- Icterus variable
- Pale mucous membranes
- No fever
- ↑ HR & RR
- Death losses can occur

- Sequelae:
  - Hemoglobin nephrosis
  - Renal failure

89

• CS

• History of exposure

(Dx of leaves)

• Lab:

- Anemia (varying degrees)
- Heinz bodies (round to oval to serrated refractile granules)
  - . Located near cell margin, or protruding
  - . Crystal violet or new methylene blue stains to unfixed blood smears
- Regenerative changes in few ds
- Coombs' negative
- Hemoglobinemia & hemoglobinuria (if profound RBC destruction)
- ↑ Serum bilirubin (indirect)
- ↑ BUN & creatinine, modest to marked (reflects risk of hemoglobin nephrosis)
- Postmortem: Pulmonary edema, splenomegaly, hepatomegaly

### DDx:

- See DDx for postparturient hemoglobinuria above

• Remove source of toxicity

- Supportive:
  - Blood transfusion if PCV < 10-12%
- IV fluid if evidence of renal damage
- Laxative (mineral oil) to empty GI of toxins

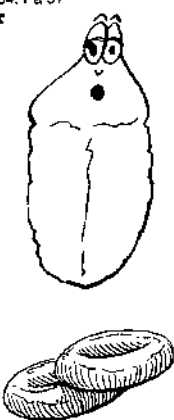

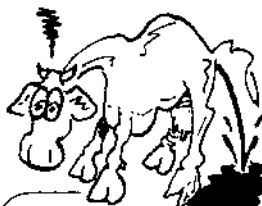

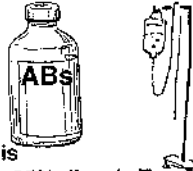

### Prognosis

- Good if modest anemia
- Poor if renal damage (but can be saved)

# Hemolytic Anemia

# CARDIOVASCULAR SYSTEM

**Hemolytic diz of newborn calves, Neonatal isoerythrololysis**

MK 21; IM 1867; C1T 857; BR-hb 149, 622; BR 364, 1612

- Rare
- Isoimmune hemolytic anemia
- **Blood derived vaccines** for anaplasmosis may contain RBC antigens given to dam, antibodies made
- Bull w/ same antigens m/ pass to calf
- **Antibodies in colostrum destroy calf's RBCs**
- Owners often revaccinate dam if see red urine from calves, exacerbating problem

- Calves normal at birth
- **CS 24-36 hours after suckle** (colostrum)
  - Variable - mild to peracute
  - Depression, weakness
  - **Pale mucous membranes**
  - Icterus mild to mod. 1-2 days
  - ↑HR, RR due to anemia
  - **Red urine**
  - Dyspnea (hypoxia)
  - Peracute - die in 24 hours
  - Mild - nonfatal anemia

- **History: dam vaccinated & anemic calf**
- **Anemia**
  - PCV 7% peracute, 18% in mild cases
- **+ Coombs' test**
- **Lytic &/or agglutination tests**
  - Dam's milk agglutinates calf's RBCs & causes hemolysis if complement added
- Postmortem
  - Pale &/or icteric, splenomegaly
  - Pulmonary edema

- **Minimize stress**
- **Confine** (↓ exercise)
- **Transfusions if severe anemia** (PCV < 15%) not usually done
- Corticosteroids
- ABS m/ help

- Prognosis:**
- Varies
  - Grave: peracute

- Prevention**
- Check vaccinated dam's litter against bull's RBCs
  - Use colostrum from another cow w/out a titer for 24-48 hrs

**Blood-derived vaccines - Colostrum**  
**CS: Anemic CS, Icterus**  
**Dx: Hx of vaccine, Pos. Coombs' test**  
**Tx: Minimize stress, Confine, Steroids**

**Trypanosomiasis** ★  
 IM 1222; Br 736

- Flagellated protozoan causing serious diz throughout world, *T. theileri* (*americanum*) only one in N. America & chiefly of academic interest. m/b seen in blood smear
- Usually not pathogenic (rarely fever, depression & ↓ milk production)

**Pink tooth, Erythro-poietic porphyria** ★  
 IM 1231; Br 153; DC 56; Pic 16; Derm 81

- **Rare congenital disorder** of hemoglobin production (1° in Holstein cattle), lack enzymes resulting in pigments that deposit in teeth & bone, Hemolysis
- **CS:** Slow growth rates, photosensitization, exfoliation of nonpigmented skin, reddish-brown teeth, modest anemia
- **Dx:** Pink fluorescence under UV light, brownish-red urine
- **Tx:** None, house indoors, out of sunlight, genetic counselling

**Babesiosis, Pyroplasmosis, Tick Fever, Texas Fever, Red Water**

Mk 69, IM 1217, 1049; C3T 584; Br-hb 451; BR 1171; Br 726; DC 55, 476

- **No new cases in USA since tick eradication program**
- **Protozoa:** *Babesia bigemina* & *B. bovis*
- **Tick, Boophilus spp.**
  - M/ also carry *Anaplasmosis marginale*
  - Combination of babesia or anaplasmosis can cause tick fever (tristeza)
- Chronic carriers
- Calves - natural immunity, can become asymptomatic carriers
- *Bos indicus*, more resistant

- Fever 104-107° F, malaise & anorexia
- **Hemolytic anemia**, rapid
- "Red water" (hemoglobinuria)
- Hypoxia, ↑HR & RR, pale muc. membr.
- Loud tachycardia
- **Icterus**, less common than in anaplasmosis
- **CNS** m/b cerebral babesiosis, hyperexcitable, convulse, opisthotonus, coma & death
- **Abortion & death**

- **CS, in tick areas**
- **Geimsa stained org.** in RBCs of thin blood smear (m/not find)
- **Anemia, PCV** sharp drop 35 to < 10%
- Complement fixation (doesn't pick up carriers)
- Direct immunofluorescence
- **Postmortem**
  - Icterus
  - Enlarged spleen

- **Tx:** depends on PCV
- Whole blood transfusions, indicated w/ signs of anoxia, limit amount, usually 4 L
- **Fluids**
- **Imidocarb®** (protozoocide) - protects new animal up to 2 mos & premunition immunity

- Prognosis**
- PCV > 12% Good w/ early Tx
  - of whole blood transfusions
  - PCV < 12% Guarded

**Control:**

- **Successful eradication of tick in USA**

**Tick life cycle - 3 weeks**

- Female ingests parasites in a blood meal, passed transovarially to larval progeny
- Tick drops off the animal & lays eggs
- Eggs to larvae which attach to a new host
- Parasites in tick saliva enter bloodstream to RBCs, merozoites break out of RBC to infect others

**DDx** (Same as anaplasmosis):

- Leptospirosis (p 257)
- Bacillary hemoglobinuria (p 90)
- RBC parasites - anaplasmosis (p 92)
- Postparturient hemoglobinuria (p 88)
- Trypanosomiasis (p 261)
- Theileriosis

**CNS signs:**

- Rabies (p144)
- Encephalitis (p 154)

**Not in USA**  
 Tick (*Boophilus*) carried  
 Protozoan (*Babesia*) eradicated

## CYSTITIS

IM 990; CGT 539; BR-hb 182;  
BR 448; BM&S 839; Br 560;  
DC 361

\*\*\*

- Sporadic inflammatory disease
- Cattle >> sheep
- **Cystitis, ureteritis**
- #1 ***Corynebacterium renale***
  - Subacute pyelonephritis
- ***E. coli***, chronic urinary infec.
  - *C. pilosum*, *C. cystitis*
- 2° **Ascending problems**
  - Urinary calculi
    - . Sets up inflam. of bladder wall
  - Difficult parturition, w/ trauma to urethra; metritis; conformational deformity
  - Handling (catheterization, etc., iatrogenic)
  - Venereal transfer
  - Urine splashing

- **Frequent urination**
- **Gross hematuria** (blood clots)
- Long urinary posture
- Painful urination - kicking at belly, swishing tail
- Scalding of perineum, thigh
- Protruded penis in male
- **Chronic**
  - **Weight loss**
  - ↓ Milk production
- **Cystitis in males - check for uroliths (stones)**

- **Almost pathognomonic: frequent bloody, painful urination containing blood clots**
- **Ultrasound** distinguishes between types
  - Rt. kidney - probe rt. paralumbar fossa
  - Lt. kidney - rectal probe
- **Renal biopsy** of lt. kidney
- **Lab: Blood**
  - Azotemia, but not until advanced
  - Inflamm. leukogram (+ PMNs)
- **Culture**
- **Urinalysis**
  - **Hematuria**
  - **Bacteruria** (> 10 <sup>4</sup>/ml)
  - Pyuria
  - Cystitis - no casts
  - **Crystaluria suggests urolithiasis**

## Treat early

- **ABS** based on urinalysis, culture & sens
  - *C. renale* - intensive penicillin
  - *E. coli* - resistant - S - ampicillin
  - **Naxcel®, \$ Ampicillin S** (broad spec) if culture not possible or *E. coli*
  - Reassess by culture & bacterial count 1 week post Tx
- **Water & salt** - flushing effect

## Prognosis:

- Cystitis - good, if Tx early

## Prevention & control

- Isolate (infectious)
- Hygiene - when handling urogenital tract
- Assoc w/ bulls, switch to artifi. insemin. (AI)
- Difficult to remove from herd once established

Female > males - short wide urethra, infection easily ascends

## 2° ascending problem

**CS:** Frequent, Bloody, Painful urination w/ Blood clots

**Dx:** Hx, CS, US, UA (hematuria, bacteruria)

**Tx:** Antibiotics, Water & Salt • **Px:** Good

## DDx:

- #1 - **Urolithiasis** (crystaluria) (p 96)
- **Enlarged kidneys** (no pyuria or bacteruria)
  - Hydronephrosis
  - Congenital cystic kidneys
  - Neoplasia
  - Amyloidosis (p 94)
- **Abd. pain**
  - GI disorders (no urinary disorders)
  - Obstruction (p 44)
  - Traumatic reticuloperitonitis (p 38)
- **Hematuria**
  - Enzootic hematuria (no pyuria or bacteruria) (p 228)
  - Leptospirosis (p 257)
  - Bacillary or postparturient hemoglobinuria (p 88, 90)

## Sorghum cystitis/ataxia, Sudan/Johnson grass; Bladder paralysis, Lathyrism

\*

- See Tox pg 242; Ataxia & cystitis in horses, cattle & sheep. Usually valuable forage. **Sorghum** spp., Johnson & Sudan grasses; Mechanism unknown, cyanide? • **Myelomalacia of lumbar, sacral & caudal spinal cord, Poisonous plants**
- **CS:** **posterior incoordination.** "Dribbling", Cystitis 2°, Scalding of skin & dermatitis, Pyelonephritis sequela. Paresis of tail m/b
- **Dx:** Hx, CS, No specific tests, Urinalysis for cystitis; PM - Wallerian degeneration & swelling of axons
- **Tx:** Withdraw Sorghum, improve over wk-mo (m/not be complete), No specific Tx, ABS for urinary tract infec.
- **Px:** Recovery rare, **Control:** Diversify diet (Sorghum not a complete diet)

Johnson grass

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Urolithiasis</b></p> <p>Mk 691; C3T 819; IM 976, BR-hb 163; BR 450; Br 127; 227; DC 364; S-J 1072; S-T 292; BM&amp;S 541; R-M 388; S-U 659</p> <p>***</p>	<ul style="list-style-type: none"> <li>• <b>Urinary calculi - big problem</b></li> <li>- <b>Feeder steers &amp; range cattle</b></li> <li>- <b>Calculi form</b> in bladder, nidus (desquamated cells &amp; necrotic tissue), solutes ppt out around nidus, mucoprotein solidifies around ppt</li> <li>- <b>Obstruction</b>, when passes into urethra             <ul style="list-style-type: none"> <li>. ### Feed lot - struvite calculi (phosphate)

- Multiple stones usually (sand to large stones)

### Range - silicate (silica plants) - single stone usually.

- Carbonate crystals less common in pastured animals

### High risk animals

#### • Castrated males >>> females

(feeder steers castrated early = small urethra)

### Blockage sites (males)

- Cattle - sigmoid flexure, ischial arch, urethral orifice - usually single

### Prevention of all syndromes

- **Water available** - heated in cold weather
- **Early detection**
- **Acidify urine**; good for phosphate calculi, not silicates
  - Ammonium chloride or ammonium sulfate
- **NaCl to diet** (2-4%) to incr. water consumption
- **Ratio of 2 to 1 Calcium to Phosphate**
- **Vit A supplement** to diet
- **Delay castration** - not at 3 months
- **Oxytetracyclines or sulfas** to decrease UT infection

Feeder steers, 5-10 mos-old, Winter, High concentrate feed  
CS: 1. Obstruction 2. Ruptured urethra 3. Ruptured bladder

## Surgeries:

### Stone removal (for unruptured cases)

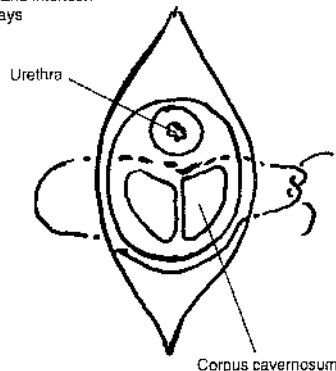

- Cast in dorsal recumbency
- Local infiltration of anesthetic, 4" area cranial to scrotum
- Grasp penis through skin
- **3" skin incision cranial to scrotum**
- Exteriorize penis by deeper incision through SQ
  - ID retractor penis mm. joining penis just dist. to sigmoid flexure (usual location of calculi)
  - Urethra runs on outside of curve (ventr.)
- **Feel stones (calculi)**
  - If possible, move stone to healthy tissue
- **Attempt to crush stone** (drive points of towel forceps into stone & massage pieces out, phosphate stones usually too soft to crush)
- **Incise into urethra** over calculi (if unable to crush)
- Tease stone out of small opening
- Flush out
- Determine state of urethra
- 1° closure if healthy & not traumatized
- Leave open if bruised, heals by second intention
- **Do not close skin**

### Penile amputation (ruptured urethra)

- Couple of incisions on ventral abdomen to drain SQ urine
- Standing bull - epidural anesthesia
- Surgically prep perineal area to scrotum
- **6" skin incise to base of scrotum** on midline
- Bluntly dissect down to penis
- Grasp penis & pull penis out incision
- **Tie vessels off**, or dissect between penis & vessels, leaving vessels in place
  - Due to retraction w/ healing (scalding of urine if too short)
- **Cut penis**, corpus cavernosum on top of corpus spongiosum
- Tie suture to skin
- Pass suture through body of penis just dorsal to urethra
- Pass suture dorsally around penis & back through penile body (acts as tourniquet to help slow bleeding of corpus cavernosum)
- Tie suture to skin
- Close skin incision, putting no pressure on urethra

### Ischial urethrotomy for ruptured bladder

- Drain abdominal cavity by paracentesis
  - Unnecessary to suture bladder, just keep it empty to heal
  - Insert an abd. drain paramedian betw. umbilicus & pubis for 48 hrs
- Standing, under epidural anesthesia
- Prep perineum
- **5" incision on midline starting 2" below anus**
- **Incise down to retractor penis & deeper to bulbospongiosus m.**
- Find tunica albuginea at dist. end of bulbospongiosus m.
- Palpate urethra
- **Incise tunica albuginea into corpus spongiosum**
- **1" incision into urethra**
- Remove stones by pushing up to urethrostomy incision w/ catheter (extend penis, by straightening out sigmoid flexure)
- **Pass a Foley catheter** w/ a stilette up urethra & into urinary bladder (inflate cuff), pushing catheter against cran. wall of urethra while passing urethral diverticulum (located caudally)
- **Close tunica albuginea**, SQ fascia & finally skin around catheter
- Put 1-way valve on end of catheter to stop negative pressure of abd. pulling air into bladder
- **Remove catheter in 5 days**
- Let heal by 2nd intention
- ABs for 3 days

# Nephron

98

# URINARY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
-----------	-------------	-----------------	-----------	-----------

## Nephritis

Br-hb 180, BR 445, DC 355; BM&S 834

- Not an important clinical entity, except for pyelonephritis or embolic nephritis
- Glomerulonephritis only noticed at necropsy w/ no manifestation of dz
- Interstitial nephritis accompanies leptospirosis, but CS more closely related to leptospirosis

## Contagious pyelonephritis

CST 626; BR-hb 181, 272; BR 447, 646; Br 560, 127; DC 358

\*\*\*

- ***Corynebacterium renale*** considered specific agent, gram positive, short thick rods
- Pili present give pathogenicity, pH < 6.8 lowers number
- Obligate parasite of cattle
- Strep, staph., *Actinomyces* (*Corynebacterium*) *pyogenes*, *E. coli* also implicated
- **Ascending infection**
- Females > males
- > 3 yr-olds
- Carrier animals
- Dairy herds, winter
- Obstruction (calculi) = stasis, important factor

- Variable: initially m/b intermittent hematuria in healthy appearing cattle or colic
- **Usually insidious onset**
- Gradual loss of condition
- ↓ Milk production
- Fluctuating appetite
- Intermittent fever
- Bloody urine & debris
- **PU** painful, small amounts of urine
- Death due to kidney failure & blood loss

- History (Hx), CS (clinical signs)
- **Rectal palpation:**
- Enlarged kidneys, ureters
- Painful kidneys
- Urinalysis:
- **Hematuria**
- **Pyuria, bacteruria**
- RBCs, WBCs, epithelial tissue debris
- **Gram stain *C. renale*, FA**
- Usually no azotemia unless bilateral, or terminal stages
- Postmortem:
- Kidney: enlarged, loss of lobulation
- Mottled, greyish-white, necrotic areas
- Dilated renal "pelvis"
- Abscesses & necrotic streaks in parenchyma
- Ureters dilated & filled w/ pus
- Bladder wall & urethra thickened, edematous, hemorrhagic & necrotic

- **Procaine penicillin G (DOC), large doses** sid 10 days
- Monobasic sodium phosphate (acidifies urine)
- Isolate, clean area
- Treat early before tissue damage
- Fluids if severely effected
- Check other animals
- Nephrectomy m/b in valuable animal (check other kidney 1st)

***Corynebacterium renale*, Ascending**  
**CS: Insidious - Renal CS (Hematuria, Dysuria)**  
**Dx: Rectal, Pyuria, Culture - PM**  
**Tx: Penicillin (DOC) • Px: Guarded**

**DDx:**

- Enzootic hematuria (afebrile)(p 228)
- Cystitis (p 95)

**Prognosis:**

- **Guarded:** relapses common, clearing infection difficult
- If tissue damage only temporary recovery, but m/ allow fattening before slaughter

## Embolic nephritis

\*\*\* DC 354

- Follows purulent infection elsewhere in body or septicemia
- Cause: *Corynebacterium pyogenes?* *E. coli*
- 1° infec - Navel ill, Mastitis, Pneumonia, Hepatitis, Peritonitis

- **Unrecognized for a long time**
- ± Abdominal pain
- Extensive damage required before uremia

**DDx:** difficult

- Pyelonephritis (p 98)
- Cystitis (p 95)

- History, CS
- Urinalysis 
- Proteinuria, pus & bacteria
- Culture
- Rectal palpation
- Misshapen kidney (late)

- **Antibiotics** (C&S, culture & sensitivity) several weeks

2° to purulent infec.

CS: Insidious

Tx: Long term ABs

## Uremia

BR 439; Sx-G 632; BM&S 829

- **Clinical signs (CS), not diz**
- Due to an inability to produce & eliminate a normal amount of urine
- Cause:
  - Circulatory defc.
  - Extensive kidney lesions (hydronephrosis, pyelonephritis)
  - Obstruction of urinary tract
  - Rupture of bladder or ureter
  - Poisonous plants
  - Heavy metals

- Depression & anorexia
- Muscular weakness, tremors
- **Labored breathing** (dyspnea)
- **Reduced urine output**
- Loss of condition
- Scleral congestion
- Ammonium (urine) breath
- Chronic uremia
- **Ulcerations of oral tissue**
- ↑HR
- Coma followed by death

- Proteinuria
- **↑ BUN, creatinine**

- **Treat cause**

## Hydronephrosis

BR-hb 181; BR 447; BM&S 836; Sx-G 634

- Distention of kidney w/ urine
- Ureteral obstruction (rarely urethral)
- Unilateral usually

- Uremia

- Unilat. difficult to detect
- Rectal palpation of dilated ureters

- Relieve 1° diz (obstruction)

## Enzootic hematuria

\*\* DC 363

- See pg 84, 228; Cause unknown, bracken fern (worldwide), > 4 yr of age, cauliflower-like **bladder wall**
- CS: Acute (blood clots in urine, anemia, die in 1-2 weeks), Chronic (anemia, bladder tumors, 2° cystitis)
- Dx: Hx (Bracken fern), CS, Rectal (bladder thickening); PM: Chronic - Pedunculated mass from bladder wall
- DDx: Cystitis (pyuria & bacteruria), Pyelonephritis
- Tx: Salvage early
- **Prevention:** Clear Bracken fern (\$)

## Interstitial nephritis

\* BR-hb 180; BR 445

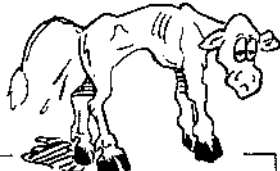

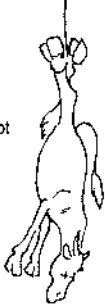

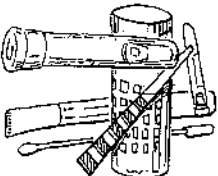

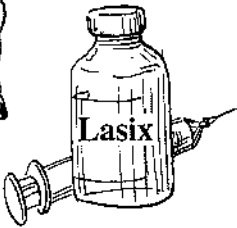

- Rare: Calves attributed to systemic coliform infec., Leptospirosis, Chronic, progressive nephritis seen in dogs, not reported in cattle
- CS: Death reported, more commonly as an incidental finding at meat inspection or necropsy
- Tx: no recommended Tx, ABs

# Renal Failure

## Oak poisoning,

Quercus poisoning,  
Oak bud or acorn poisoning

- See Tox pg 234; Oak, *Quercus* spp., SW USA (buds in spring), Midwest & NE (acorns in fall); #1 Cattle; Oak tannin
- CS: Gradual onset; Peracute (edema, anuria, m/b found dead); Subacute (diarrhea); Advanced stages (large volumes of dilute urine, dehydration, icterus, hematuria, ammonium breath, oral lesions, occasional abortions)
- Dx: Hx, CS, ↑ SGOT, SGPT, BUN & creatinine, dehydration, Low specific gravity, granular casts & hematuria; PM: edema, perirenal edema, renal lesions
- DDx: Pigweed poisoning (similar lesions); Aminoglycosides poisoning, Clostridial diz, Viral diz (oral lesions)
- Tx: Remove from oaks, Stimulate rumen (oils), Fluids (dehydration & acidosis), Supplemental feed
- Px: Grave - rarely recover once renal dysfunction
- Prevention: 10-15% calcium hydroxide in grain ration to protect m/b, if exposure can't be prevented

**Amaranthus, pigweed:** See Tox pg 234: similar to oak, Acute tubular necrosis & perirenal edema in cattle & pigs, Toxic element not identified

## Mycotoxins

- See Tox pg 265; *Aspergillus* & *Penicillium* spp., Nephrotoxic

## Oxalate

- See Tox pg 224; Halogeton, Greasewood, 1° cattle, West, Insoluble ppt w/ Ca, Vascular necrosis & renal tubular blockage
- CS: Colic, Weakness, Frequent urination, Crystals in urine
- Tx: Hopeless once CS; Fluids, Ca gluconate

## Aminoglycosides

★★

- See Tox 217; One of most common causes of tubular nephrosis
- Neomycin most nephrotoxic > gentamycin > kanamycin > streptomycin (least)
- Accumulate in tubular epithelial cells, disrupt metabolism & die

**Sulfonamide & tetracycline ABs** (C3T 818): Sulfonamides cause crystalluria, mainly of older sulfas (sulfathiazole), Tetracycline problem w/ high dose.

**NSAIDs** (C3T 818): Not a potent nephrotoxin, m/b if given w/ aminoglycoside or if hypotension or dehydration; causes papillary necrosis & interstitial nephrosis

## Amphotericin B ★

- Antifungal drug, nephrotoxic even at therapeutic doses, too expensive to use in cattle

## Ethylene Glycol,

Antifreeze

★

- See Tox pg 209; 1° dogs & cats, 1° lg. animal is ruminants, Sweet tasting alcohol, forms insoluble Ca oxalate in renal tubules
- CS: Hind limb ataxia, Salivation, Depressed sensorium, Nystagmus, Tonic clonic seizures, Status epilepticus, Acidosis, Dehydration
- Dx: Azotemia, ↑ serum creatinine, Oxalate crystals in kidney, microscope using polarized light
- Tx: Early w/in 12 hr of exposure, 20% ethanol (50 ml/hr), Activated charcoal, NaHCO<sub>3</sub> IV, Replace fluids

## Heavy metals

(C3T 823)

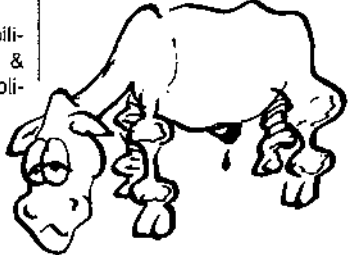

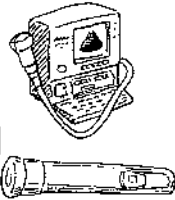

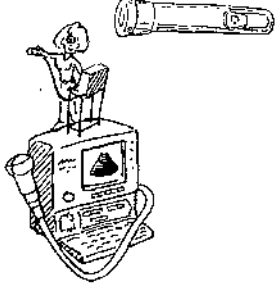

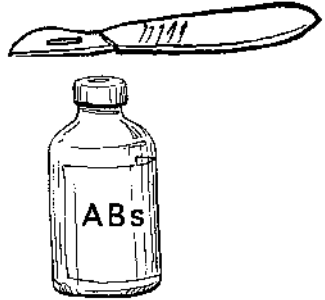

★

- See Tox; Rare, Hg (mercury), Arsenic, Cadmium, Lead
- CS: GI signs (↑ salivation, oral erosions, colic, hemorrhagic diarrhea); CS of uremia (depression, seizures, oliguria)
- Dx: Tubular necrosis, azotemia, isosthenuria, enzymuria, & electrolyte imbalances
- Tx: Dimercaprol, 1 lb of activated charcoal orally, ARF (acute renal failure) Tx

## Neonate

## URINARY SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Patent urachus</b> IM 421; CST 321; BR-hb 186; BR 101, 455; DC 365; S-J 1110; Br 152 ***	<ul style="list-style-type: none"> <li>• Urachus connects bladder w/ allantoic sac during gestation</li> <li>• <b>Should close at birth</b> when umbilical cord is severed</li> <li>• Early severance or ligation of umbilical cord, inflammation, infection &amp; excessive handling of neonate implicated</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Moist hair around navel</b></li> <li>• <b>Dribbling of urine from umbilicus</b></li> </ul> 	<ul style="list-style-type: none"> <li>• Moist dribbling umbilicus</li> <li>• Lab: Serum IgG, CBC, urinalysis for systemic infec.</li> <li>• Ultrasound</li> <li>• Check for FPT (failure of passive transfer)</li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Conservative</b></li> <li>- <b>Chemical cauterization:</b> Tincture of iodine on cotton swab &amp; swirl around inside urachus, must not be infected. <b>Most respond</b></li> <li>• <b>Surgery:</b> remove urachus, taking off tip of bladder, remove umbilical v. &amp; aa. as well</li> </ul>

Estrus detection	105	Neospora abortion	123	Repeat breeders	104	Windsucker	113

# Anestrus

# REPRODUCTION

## Anestrus

IM 247, 1373; Mk 1127; BR 456; R-M 247

\*\*\*

- Anestrus: lack of estrus
- A clinical sign, not a diz; M/b normal physiological phenomenon, a sign of diz, or indicative of poor heat detection
- **Pregnancy #1 cause of anestrus - rule it out 1st. Seasonal anestrus** in horses, not in cattle, which are not considered to be seasonal breeders
- **Prolonged luteal function/persistent elev. progesterone**
  - Causes: pregnancy, mummified fetus, pyometra
- **Dx:**
  - Reproductive & general history (Hx)
  - Thorough breeding soundness exam (BSE)
  - Evaluate estrus detection program
  - Rule out (R/O) pregnancy 1st
  - Animal side milk or serum progesterone test kits

### Causes (IM 244, 1367)

- Pregnancy (p 106)
- Poor heat detection (p 106)
- Luteal cysts (p 108)
- Nursing beef cow
- Nutritional infertility/Weight loss (p 266)
- Heat stress
- Freemartinism (p 107)
- EED (early embryonic death)

- Urine pooling (p 113)
- Pyometra (pg 111)

### Less common causes:

- Macerated or mummified fetus (p 107)
- Hydrometra or mucometra

### Uncommon causes:

- Ovarian tumor
- Segmental aplasia (p 113)

## Repeat breeders

IM 249; C3T 101, 821; BR 140; Br 449

\*\*\*

- **Bred during 3 or more successive periods w/o becoming pregnant**
- Management goal: < 10-15% repeat breeding in herd
- Pathogenesis
  - FF (failure of fertilization)
  - EED (early embryonic death)
- **DDx FF from EED**
  - Interestrus interval
    - . FF not affected
    - . EED prolongs interval (intermediate length to multiples of normal cycle lengths)
      - .. After maternal recognition of preg. at 15-17 d
  - FF &/or EED
    - . Heat stress incr. EED & by affecting spermatogenesis, also incr. FF

### Diagnosis:

- **Evaluate heat detection**
  - **Milk progesterone level** to see if cow is in heat
- **Evaluate breeding technique**
- **Herd problem (multiple cows)**
  - **Bull or AI evaluation**
    - Physical condition, Semen quality, libido & ability to mount
      - . Trichomoniasis & campylobacteriosis
    - AI (artificial insemination) technique (semen quality): evaluate thawing, transportation, timing & deposition techniques
  - **Individual problems - Cow**
    - Body condition - poor nutrition
    - Reproductive exam
      - . Urine pooling - FF (spermicidal)
      - . Cervical canal occlusion - FF
      - . Postpartum metritis - pus & debris - FF
      - . Endometritis & little pus - EED, not FF

- Uterine culture
- Cytological smear
- Endometrial biopsy
  - Embryo flushing to DDx FF from EED
    - . Collecting unfertilized egg - FF
    - . Collecting degenerating embryo - EED
    - . Failure to collect either indicates oviduct blockage
- **Ultrasound detection of pregnancy**
  - . Loss of embryo after detection w/ ultrasound confirms EED

### Common causes:

- Poor heat detection (p 105)
  - Poor AI timing/technique
  - Malnutrition (p 266)
  - Follicular cysts (p 108)
  - Endometritis (p 111)
  - Campylobacteriosis (p 110)
  - Leptospirosis (p 121)
  - Trichomoniasis (p 120)
  - Inadequate involution of uterus
    - EED (early embryo death) (p 104)
- See DDx chapter for less common & uncommon causes

## Pregnancy diagnosis

CST 126, 144, DC 349; R-M 121; VC/T 234

\*\*\*

- **Early & accurate Dx important economically**
  - 25% that are bred & don't return to estrus are not pregnant
  - Predict parturition date
  - Separate pregnant from nonpregnant
  - Beef herd Dx & cull nonpregnant before winter feeding period

### Presentation:

- Enlarged abdomen
- Udder enlargement about 4th month of pregnancy
- SQ edema of udder, teat & abd. wall in last 1-3 wks of gestation
- Mucous from vulva last 2 months of pregnancy

## Dairy cows (AI)

- Rectal palpation at least **35 days** after AI
  - CL always present in pregnancy (also in mid estrous cycle) on side of gravid horn
  - ↑ in size of horn, accumulation of fetal fluid - 28 days
  - 4 positive signs of pregnancy
    - .. 1. "Membrane slip", chorioallantoic membrane - 30-35 days
    - .. 2. Amniotic vesicle - 30-35 to 70 days; 3. Placentomes 65-70 days
    - 4. Fetus 65-70 days (not felt at 35 days)
- Milk progesterone assay - Collect 21-24 ds after breeding
  - Low level indicates nonpregnant (95% accurate)
  - Hi level possible pregnancy (75% accurate); inaccuracies usually due to EED or cystic ovaries
  - More useful in determining nonpregnancy than pregnancy

## Beef cattle are palpated later; those not pregnant are culled

- CL always present in pregnancy
- Placentomes: 65-70 days
- Fetus 65-70 days earliest, but maybe out of reach
- Uterine artery to gravid horn enlargement - 90 days (fremitus/pulsation)

## Natural breeding & AI (Artificial insemination)

CST 121, 799, Br 454; R-M 162, 383

\*\*\*

- **Calving interval economic goal**
  - Beef cows: 12 month calving interval
    - Beef cow must calve every 12 mo in a defined calving season or are culled
  - Dairy cattle: 12-13 month calving interval
    - Managed to maintain high level of milk production
    - Cows that don't conceive or conceive too late are culled
- **Natural breeding**
  - Most beef cattle are bred naturally (95%)
- **AI (Artificial Insemination)**
  - **Dairy cows** - most are bred by AI (75%)
  - **Some purebred beef AI'd** once & then put out w/ a "clean up" bull (to get those not pregnant)
- **Cow categories**

- Pregnant cows
- Postpartum anestrous cows (calved w/in last 45 ds, time for involution & return to estrus)
- "Open" cows to be rebred
  - **35-50 d** to be rebred for a 12 mo calving interval
  - 285 days gestation
  - 45 d postpartum period (before back in estrus)
  - Excessive "days open" - 90% due to failure of heat detection

## Timing of AI

- **AM-PM rule:** insemination between middle of estrus to 6 hrs after estrus
  - If observed estrus in morning - inseminate in afternoon of same day

- If observed estrus in afternoon, inseminate following morning

## Factors affecting AI fertilization rates

- Maintain semen at -130° C or lower at all times (prevents recrystallization)
- Inseminator expertise: place semen in uterus (junction of cervix & uterine body) quickly w/ minimal trauma to cervix & endometrium
- AI fertilization rates of 90-100%, similar to natural breeding possible w/ proper technique
- Average 60-90 day nonreturn rates - 70%

## Anestrus, Prolonged luteal function

Mk 1127; IM 1528; C&T B10; Br 478; BM&S 979; R-M 208; T 247

\*\*\*

- Presentation: anestrus
- **Persistent elev. progesterone** > 1 ng/ml in all
- Causes: pregnancy, mummified fetus, pyometra, luteal cyst
- **Pregnancy:** Dx: Fetal membrane slip, Amniotic vesicle, Placentomes, Palpable fetus
  - Tx: Let calf, seldom unwanted pregnancy Unwanted pregnancy PGF<sub>2a</sub> betw. 7-150 ds, PGF<sub>2a</sub> + dexamethasone (20 mg) beyond 150 ds
- **Fetal mummification/maceration:** Dx: Palpation of dried, leather-like fetus, No fetal membrane slip, No placentomes, Full term & no abdominal swelling
  - Tx: PGF<sub>2a</sub> injection, fetus usually expelled in 3 days; Manual removal if not expelled in 4 days
- **Pyometra:** Dx: No positive signs of pregnancy, Uterine enlargement, Vaginal discharge m/b

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Freemartinism, Twinning</b> Mk 673; C&T 302, 310; IM 1530, 1757; BR-hb 630; BR 109, 1627; Br 153; BM&S 973; Pic 163 **	<ul style="list-style-type: none"> <li>• <b>Female born co-twin to a male, causing it to have a defective genital tract</b></li> <li>- Anastomoses of placental circulation to the twin fetuses</li> <li>- Male differentials 1st &amp; transfers X-Y antigens which inhibits development of ovaries</li> <li>- 90% of female twins are freemartins</li> <li>- Single freemartin if male lost after 30 days of gestation</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Anestrus female</b></li> <li>• Small vulva</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Rectal</b> (breeding age animals)</li> <li>- <b>Hypoplasia of tubular genital organs</b></li> <li>- Hypoplastic ovaries</li> <li>• <b>Small animals (rare)</b></li> <li>- Small glass speculum                             <ul style="list-style-type: none"> <li>• Short vagina (rarely extends past urethral opening)</li> </ul> </li> <li>• <b>Karyotype</b> suspect female - male cells found</li> </ul>	<ul style="list-style-type: none"> <li>• No Tx</li> <li>• <b>Cull</b></li> </ul>

## Teaser Bulls

R-M 375; S-T 287, 270; S-O 540; S-UG 27

\*\*\*

- **Bulls sterilized or made unable to achieve intromission**
- Used to identify cows in estrus, esp. w/ AI program in beef cattle
  - Mount cows in estrus & thus identify them (if someone is watching)
- **Prevent ejaculation** (Vasectomy, Epididymotomy, Urethrotomy)
  - Both vasectomy & epididymotomy allow intromission & possible spread of diz
  - Check sperm content before utilizing
- **Prevent insertion** (Suture penis to abd. muscles, Penile deviation)
  - Prevents spread of venereal diz
- Problem: bulls lose interest & need to be replaced in time

## Vasectomy: - remove 1" of vas deferens

- Ejaculate at least 3 times before using as teaser (examine for sperm)

## Epididymotomy - quick

- Stab tail of epididymis & w/ pressure prolapse tail
- Cut off tail w/ scissors
- Check semen in 3 months to see if reunion has occurred

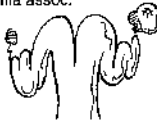

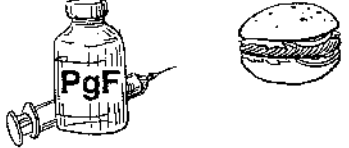

## Penile deviation

- Want a bull that has bred cows, usually older, success rate better
- Circular incision (3" diameter) around preputial orifice
  - Circular skin incision (3") in flank region (just caud. & lat. to prepuce)
  - Make SQ tunnel from flank to base of scrotum
  - Drag prepuce through tunnel
  - Suture prepuce to surrounding circular incision edges
  - 6 weeks of rest afterwards
- Can combine w/ removal of tail of epididymis or vasectomy

## Ovary

## REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Ovarian hypoplasia</b> IM 1530; C3T 782; VC/T 302; BR 975; Br 152; S-O 588	<ul style="list-style-type: none"> <li>• Sporadic</li> <li>• Autosomal recessive trait</li> <li>• Partial or complete; unilateral or bilateral</li> </ul> 	<ul style="list-style-type: none"> <li>• Anestrus</li> <li>• Sterile</li> <li>• Subfertile</li> </ul> 	<ul style="list-style-type: none"> <li>• Rectal palpation</li> <li>- Ovaries: cord-like thickenings to bean-sized</li> <li>- Uterus: cord-like to near normal size</li> </ul>	<ul style="list-style-type: none"> <li>• None</li> <li>• Cull</li> </ul>  <div style="border: 1px solid black; border-radius: 15px; padding: 5px; display: inline-block;"> <b>DDx</b> <ul style="list-style-type: none"> <li>• Nonfunctional ovaries &amp; anestrus from</li> <li>- Malnutrition</li> <li>- "Debilitating diz"</li> </ul> </div>

<b>Follicular or Luteal cysts</b> <b>CS: Anestrus or Nymphomania, "Buller" cows</b> <b>Dx: Hx, CS, Rectal cysts</b> <b>Tx: Luteinize (hCG, GnRh, PgF2a)</b>				

## Ovariectomy, "Spaying"

Mk 674; S-UG 99; VC/T 385

- Indicated
  - Pathological ovaries
  - Beef up young
  - Prolonged, uninterrupted milk production if done at height of cow's milk production (6-8 weeks postpartum)
  - Stop fertilization (don't have to worry about dystocia, etc.)

## Feedlot mass "spaying" (can do many in a short time)

- Done in chute
- Lt. flank, knife to cut through skin & ext. abd. oblique muscle
- Twist hand through int. abd. oblique & peritoneum
- Grab both ovaries & snip off w/ scissors
- Ligation of ovarian stumps unnecessary
- Close abdomen w/ several interrupted "through & through" sutures

## Midline in tiny calves

- Similar to cat
- Bringing ovaries to incision site (just cranial to udder)

## Older cows w/ larger vagina

- Epidural anesthesia
- Incision through vagina & peritoneum dors. to cervix
- Incision dilated w/ fingers until hand in abd.
- Pull ovary into vagina
- Remove w/ ecraseur
- Careful not to involve small intestines
- Vaginal incision is not sutured

## Ovarobursal diz, Ovarian hemorrhage

C3T 782; IM 1532

- Adhesions between ovary & fimbriae (mild to severe), uncommon in heifers, but ↑ w/ age, hemorrhage of ovulation. Acquired infection (mycoplasma) or trauma (manual enucleation of corpora lutea [archaic practice assoc. w/ Tx of anestrus or pyometra]; prostaglandin Tx has replaced this practice)
- CS: Infertility - prevent entrance of ova into uterine tube, Rt > Lt ovary
- Dx: Difficult: rectal m/ find some; US, Exploratory in valuable cows
- Tx: If unilat. palpate & breed when ovulation on unaffected side; Surgical removal of unilat. affected ovary

## Salpingitis

C3T 782 C2T 789; IM 1532;  
BR 908; Br 453, DC 340;  
VC/T 319; Pic 166

★★

- Uterine tube inflammation
  - Enlargement of uterine tubes
  - Bilateral or unilateral
- Causes:
  - Following uterine infections
    - . Necrotizing & granulomatous salpingitis
    - . *Actinomyces (Corynebacterium) pyogenes*, *Mycobacterium tuberculosis*, *Brucella abortus*
    - . Mild infection, *Campylobacter fetus* sp. venerealis, *Trichomonas foetus*
  - Sequela to ovarian manipulation
  - Sequela to aggressive irrigation of uterus
  - Inappropriate estrogen hormones

## • Infertility

## • History (Hx), Clinical signs

- Rectal
  - Mild, m/b missed
  - Insert fingers into ovarian bursa & roll tube betw. fingers & thumb
- Exploratory laparotomy, or peritoneoscopy
- Embryo recovery indicates 1 or both tubes patent

## • Usually unsuccessful

- Sexual rest in valuable animals
- Uterine lavage (like when harvesting embryo) m/b therapeutic

## Prevention:

- Prevent ovarian trauma (rupture of cysts or corpora lutea)
- Avoid excessive irrigation of uterus by infusion (100 ml in heifers or 150 ml in cows are excessive volumes)
- Avoid estrogen administration
- Prevent uterine infections

## Uterine tube inflammation

CS: Infertility • Dx: Rectal

Tx: Unsuccessful • Px: Poor

## DDx:

- Ovarian neoplasia
- Parovarian cysts
- Cystic ovary (p 108)

**Pyosalpinx:** segmental accumulation of pus in uterine tubes

**Hydrosalpinx:** accumulation of serous to mucoid fluid in uterine tube; sequela to chronic salpingitis

# Uterus

# REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
-----------	-------------	-----------------	-----------	-----------

**Retained placenta (RP),**  
**Retained fetal membranes**

Mk 698; CST 769; C2T 773; IM 265, 1533; BM&S 960; BR 45, 1490; Br 428; DC 315; R-M 237; VC/S 313; T 237  
 \*\*\*

- Cotyledonary placenta
- Retained fetal membranes
  - Normally expelled in 3-8 hrs
  - Retained if >12 hrs
- Dairy >> beef
- 10% retained placenta expected
- Predisposing factors
  - Male calves (larger)
  - Twins
  - Dystocia
  - Short or long gestations
  - Uterine torsion
  - Dexamethasone induction of labor
- Cause:
  - Fetal cotyledons fail to separate from maternal caruncles
  - Early calving (short gestation retards separation)
- Minimum effect on fertility (in absence of 2° reproto. abnormalities)
- Less of an emergency than in mare

**CS & Dx: Retained if > 12 hrs, no emergency**  
**Tx: Let fall out**  
**Px: Minimum effect on fertility**

- **RP usually obvious**
- **Majority: no serious CS**
  - Transient ↓ in appetite & milk production
- Malodorous discharge & unsightly tissue hanging out
- 4-10 days usually expelled (w/ caruncle necrosis)

- DDx:**
- Prolapsed uterus (p 112)
  - Prolapsed urinary bladder
  - Prolapse of part of GI tract through genital rupture
  - Prolapsed rectum or vagina
  - Twin fetuses

- **RP hanging out vulva** (partial retention m/ occur w/o anything hanging out)

- **Spontaneous in 4-10 days**
- **No Tx is best Tx**
- **Control intrauterine bacteria**
  - Manual removal, only if gentle traction w/ rotation works
  - **Contraindicated** if CS of septicemia (sequelae: septic metritis & peritonitis)
    - . Many owners insist on removal
- **IV calcium solution** - if 2° to hypocalcemia
- Intrauterine oxytetracycline m/ reduce metritis, but pyometra m/ occur anyway, m/ reduce fertility
  - Doesn't expel placenta (necrosis does that)
- **Intrauterine ABs** if septic metritis
- Oxytocin of questionable value (doesn't reduce RP in normal calving or dystocia)
- Prostaglandins of little value

**Prognosis:**

- **RP > 12 hrs** more likely to develop metritis
- RP w/o metritis - minimal effect on fertility

- Prevention:**
- **Difficult** (sporadic & uncertain of cause)
    - Vaccine against infec. causes abortion (associated w/ RP)
    - Adequate dry period 6-8 weeks
    - Balanced ration (Ca, K, Vit. A & E & Se)
  - **Injection of Selenium & Vit. E** one month prior to calving in selenium defc areas

## Uterine infection

### Endometritis, Metritis, Pyometra

Mk 692; C3T 770, 784; C2T 775; IM 1535; BR 908; T 227; Br 428, 455, 544; BM&S 967; DC 309; R-M 227. Pic 171

\*\*\*

- **Endometritis** (endometrial inflam.)
- **Metritis** (inflam. of ALL layers of uterus)
- **Pyometra** (accumulation of pus in uterus)
- **Causes:**
  - Abnormal parturition
  - Gross contamination
- **Organism:**
  - **Actinomyces pyogenes**
    - . Gram neg. anaerobic bacteria
  - Coliforms, *P. aeruginosa*, hemolytic Strep., gram pos. & gram neg. anaerobic bact.
  - Synergism betw. *A. pyogenes*, *Fusobacterium necrophorum* & *Bacteroides* spp to incr. severity
  - Clostridium occasionally - severe gangrenous metritis
  - **Penicillinase bact.** have little effect on fertility, but stop effectiveness of pen. when treating other bacteria
- **Predisposing factors:**
  - **Retained membranes**
    - Abortion, concurrent systemic diz, mal-nutrition, fat cow syndrome (over fed during dry period), imbalance of Ca & P in feed, contaminated enviro. during calving, dystocia & manipulation
  - **Beef < dairy** bec. calf in uncontaminated pasture
- **Involution of uterus:**
  - Normally occurs by 10-15 days (before that can't be safely retracted)
  - Fluid abnorm. after 14-18 days
  - Involution & repair by 40-50 days

**RP, Metritis worse than endometritis**

**CS: Metritis: Genital discharge, Sepsis • Pyo.: Anestrus**

**Dx: Hx, CS, Rectal**

**Tx: Metritis: ABs, Infusion, Oxytocin • Pyo: PgF & Rest**

- **Repeat breeder**
- **Endometritis normal**
  - 2-4 weeks after calving
  - Slight opacity to estrual mucosa
  - Slightly enlarged uterus
  - Abnormal if fetid or cow develops other CS
- **Metritis**
  - **Discharge from genital tract**
    - Septic metritis
      - . Fever, depression
      - . Anorexia
      - . Laminitis
    - Decr. milk yield
    - Unwilling or unable to rise
- **Pyometra**
  - **Few clinical signs, not ill**
  - **Anestrus** main complaint (persistent CL)
  - M/b vaginal discharge
- **Complication of metritis**
  - Peritonitis (perimetritis)
  - Laminitis

- **History, CS** (clinical signs)
- **Vaginal speculum**
- **Rectal palpation**
  - **Palpate fluid** (lochia or pus in uterus)
    - . Fluid abnormal in uterus after 14-18 days
    - . Friable & swollen uterus (be careful)
    - CL if pyometra
- **Microbiology**
  - **Bacterial cultures** - don't support or deny Dx of endometritis (contamination problem)
  - Used for sensitivity & tentative Dx
- **Lab**
  - Severe degen. lt. shift, toxic immature WBCs & marked incr. PMNs
  - Associated w/ toxemia & sepsis

**Lochia** (normal vaginal discharge during 1st or 2nd wk postpartum) m/ look bad, but normal unless has a foul odor  
R. Youngquist knows some funny words!

#### Cause:

- Barriers to infection of endometrial cavity (uterus)
  - Vulva, vestibular sphincter & cervix
- Parturition breaches all borders, also service & AI, exam, or defect in a barrier
- Bacteria that enter usually transient & eliminated during puerperium (period of confinement after labor)

- **Systemic prostaglandins** shortens estrous cycle, no milk withdrawal time
- **Systemic ABs** minimum of 3 days
  - Trimethoprim-sulfadiazine, tetracyclines, ampicillin (esp. if concurrent urinary tract infec.) & penicillin
- **Oxytocin** (evacuate uterus before large infusion) usually effective w/in 48 hours of parturition, if not, siphon
- **Uterine infusion** (large volumes [250- 500 ml] before involution)
  - **Oxytetracycline** in povidone every 2nd day + penicillin systemically if fever
  - Observe withdrawal times in dairy cows
  - 1<sup>o</sup> pathog. *A. pyogenes* & gram neg. anaerobes
- **If not systemically ill, spontaneous recovery common**
- **Chronic**
  - Antibiotic infusion
  - Disinfectants (Lugol's sol.) causes necrosis of endometrium & regeneration m/ improve potential

#### Pyometra - destroy CL

- **PgF2a** (TOC) (3-9 days evacuation of uterus in most cows)
- **Sexually rest 30 days** (allows endometrium to heal)

#### Prognosis:

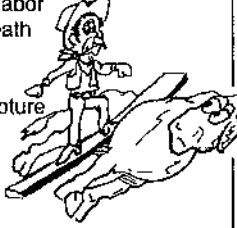

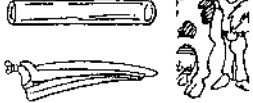

- Endometritis - Good if doesn't progress
- Pyometra - Good, esp. if Dx & Tx early

#### Prevention:

- Good nutrition
- Sanitation at calving & early postpartum period

<p><b>Unrecognized &amp; Untreated</b></p> <p><b>CS: Straining at parturition, Sudden death</b></p> <p><b>Dx: Hx, CS, Rectal palpation</b></p> <p><b>Tx: Try to untwist: "plank &amp; roll", C-section</b></p>				

**Uterine tears** • If occur during parturition, need to be sutured, usually abdominal so must do abd. approach to repair tear

**"Windsucker", Pneumovagina**

IM 1546; S-O 559  
\*\*\*

- Occasional cause of infertility in cows (#1 cause of infertility in mares), Aspiration of air & contamination into vagina. Trauma to vestibule or vagina
- CS: Infertility
- Tx: Caslick's surgery + sexual rest, partially sew vulva closed

**"Urine pooling" Urovagina**

IM 1546; R-M 345; VC/T 311  
\*\*\*

- Urine accumulating in vagina
- Cause:
  - Obstetric trauma that alters conformation (cranial vagina falls below pelvic floor)
  - Delayed uterine involution
- Toxic to sperm
- ± Continuous or only occurring during estrus

- Cervicitis
- Endometritis
- FF (failure of fertilization)

- History (FF), CS
- Palpation/visualization

- Some spontaneously correct during involution
- Surgical correction

**OB trauma, Urine toxic to sperm**  
**CS: Infertility (FF)**  
**Tx: Time or Sx**

**Tumors of uterus, cervix, vagina** (IM 1544; DC 321, 333) • Rare; Uterine, cervical or vaginal tumors; Leiomyomas (benign), Lymphosarcoma m/ affect uterus (Px: Poor)  
Large tumors must be differentiated from normal fetus, placentomes & abscesses

**Segmental aplasia, White heifer diz**

IM 1544; R-M 1921, 476  
\*

- Sporadic occurrence in all breeds of cattle, failure of part of genital tract to develop; cranial parts usually develop (ovaries, uterine tubes & uterine horns), m/ only be imperforate hymen (endometrial secretions can't escape)
- CS: Anestrus (fluid accumulation interferes w/ PGF release & luteolysis of CL)
- Dx: Rectal palpation
- Tx: Slaughter; Tx only for imperforate hymen (Sx incision releases fluid accumulation)

**Hermaphrodite** (BR 1853; BR-hb 632; Br 152) • Both true & pseudohermaphroditism • Tx: None, sterile, salvage

**Hydrops amnii & hydrops allantois, Fetal dropsy**

BR 308; Br 479; DC 323; R-M 207; S-J 1113  
\*\*

- Edema of chorioallantois, extreme accum. of fluid; Cause unknown, ankylosis of calves
- CS: Enormous abd. last trimester (both flanks & ventrum), dyspnea, death • Sequela: rupture prepubic tendon
- Tx: Prostaglandin F<sub>2a</sub> (TOC) to induce parturition, Corticosteroids & oxytocin to hasten uterine contraction after parturition
- Px: Extremely guarded, recurrence uncommon, no prevention

**Rupture of prepubic tendon, Prepubic desmorrhhexis** (DC 326; Pic 45, 167)

- Cause hydrops allantois, excessive weight on abdomen

# C-Section in the Cow

## C-section, Cesarean, Cesareotomy, X-section

IM 262; S-O 594;  
S-T 318; S-UG 85;  
R-M 350

### • Considered in dystocia:

- Non-relaxed cervix (despite massage), uterine laceration, torsion (nonresponsive to repositioning) or rupture, oversized fetus (small heifer, large fetus), dead fetus (fetotomy 1<sup>st</sup> choice), monster fetus (fetotomy 1<sup>st</sup> choice), Hydrops allantois, irreducible malpresentations, severe placental hemorrhage near term, severely prolapsed vagina

### • Contraindicated as not economical - mummified fetus

### • Cesarean section or fetotomy is a judgement call

- Advantage of C-section: Possibility of live fetus, easier on small heifer
- Fetotomy requires experienced surgeon

### Procedure for all approaches

- Surgical prep., restraint, anesthesia
- Open through either flank or ventral abdomen
- Explore abdomen & judge condition of uterus
- Grasp limb & pull tip of uterine horn out of incision
- Cut over greater curvature (avoid cutting cotyledons)
- Deliver fetus using sterile OB chains (in hospital use overhead hoist)
  - OB chains on legs if cranial presentation
  - Pull head out if posterior presentation before OB chains on limb
- Enlarge incision if danger of tearing uterus
  - Remove live calf slowly as in normal birth, do not tear umbilicus until breathing, stable & pulsation of umbilical artery subsides
  - Break umbilicus a distance away from body so can mummify & protect from infection
- Avoid spilling contaminated fluids (normal fluids are OK)
- Assess placenta - if loose remove, if not, leave in
- Insert uterine medication
- Connell or Cushing suture (inverting) closure of uterus (bury knots)
  - Start from prox. side bec. involuting uterus w/ pull quickly back into abd.; 2nd row w/ be required or contraindicated (Infect.)
- Replace uterus in normal position
- Close abdomen
- Oxytocin for involution & milk let down
- Antibiotics if worried about contamination
- Treat calf's navel w/ iodine

# REPRODUCTION

### • Sequelae of C-section

- Risk of contamination & peritonitis
  - . Normal uterine fluid - no harm
  - . Dead (emphysematous fetus) causes problems
- Adhesions principle determinant of success rate (breeding after C-section)
  - . To prevent need atraumatic Sx, lavage & bury knots

### Approaches

#### 1• Standing C-section

- Limited to easily restrained cows that can stand throughout procedure
- Contraindicated for emphysematous fetuses (peritoneal contamination)
- Left paralumbar vertical incision
  - Easiest of all C-section approaches
  - Limits postsurgical herniation
  - Minimum restraint & assistance

#### 2• Dorsal Recumbency

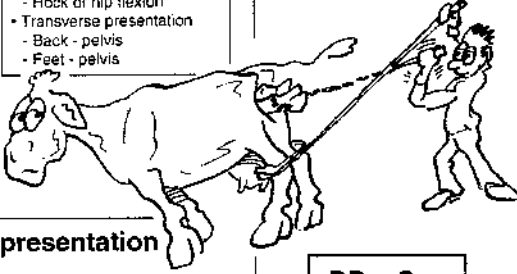

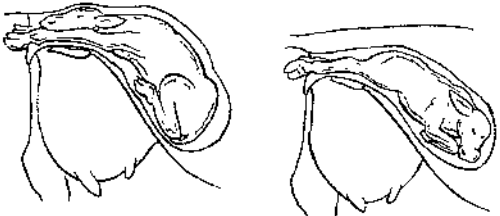

- Right or left paramedian (disadvantage SQ abdenal veins) or Midline
  - Advantages - Ease of exteriorizing uterus, Better drainage of fetal fluids (important if emphysematous fetus), Fetotomy easy to perform, easier to suture uterine tears, easier to self since incision not as visible
  - Disadvantages - dehiscence of ventral incision more likely, Not as easy as left standing, rumen tympani & breathing compromised, requires more assistance, usually takes longer

#### 3. Lateral recumbency

- Oblique incision best, incise just inside fold of flank
  - Advantage - directly over uterus, Done in lateral recumbency, has all of other dorsal recumbency advantages

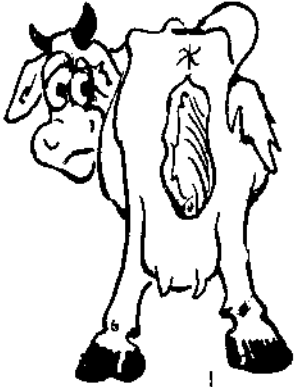

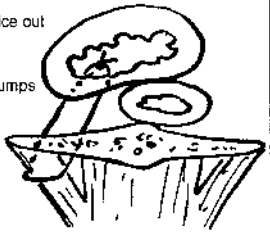

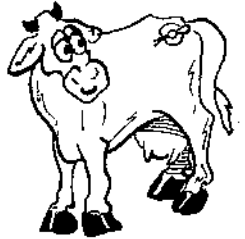

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Dystocia</b>  IM 260; BR 109, DC 319; R-M 123, 214; VGT 323  ***</p> 	<ul style="list-style-type: none"> <li>• <b>Difficult delivery</b> <ul style="list-style-type: none"> <li>- When either of 1st or 2nd stages of parturition are prolonged or not progressive</li> </ul> </li> <li>• <b>Major cause of calf losses</b> (34-50%) <ul style="list-style-type: none"> <li>- Highest in heifers calving for 1st time</li> </ul> </li> <li>• <b>#1 fetus too big for maternal pelvis</b> <ul style="list-style-type: none"> <li>- Inversely proportional to replacement heifers age &amp; size</li> </ul> </li> <li>• <b>Three Stages of Parturition</b> <ul style="list-style-type: none"> <li>- Stage 1: characterized by restlessness &amp; occas. colic signs <ul style="list-style-type: none"> <li>. ## Vulvitis & Vaginitis

Mk 701; C3T 773; C2T 778;  
IM 1546; BR 908; DC 330,  
334; VC/T 312

\*\*\*

- **Trauma**
  - Breeding
  - Parturition
  - Exam
  - Relief of dystocia
- **Pneumovagina**
- **Bacteria nonspecific** (*A. pyogenes*, *E. coli*, Staph. & Strep.)
- Fertility usually not compromised

- Moderate discharge - mucopurulent
- **Congestion & edema of vagina**
- Tenesmus
- Anorexia

### DDx:

- Vaginal discharge
- Retained placenta (p 110)
- Rabies (p 144)

- Hx, CS
- PE

- **Mild: spontaneously recover**
- Lavage of vagina (dilute aqueous antiseptics)
- Epidural (if tenesmus & aspiration of air)
- Caslick's (prevent aspiration of air m/b)

- Prognosis:
- Good - mild
  - Necrotic - m/b fatal

## Granular vulvitis

Mk 701; C3T 773; IM 1547;  
BR 908; DC 335; VC/T 311

\*\*

- **Irritants or antigens** - nonspecific hyperplastic lymphatic response
- Similar hyperplasia of lymphatic follicles of bull's penis
- Young animals - antigens
- Cause:
  - IPV
  - Most unknown - idiopathic
  - *Ureaplasma diversum*

- **Raised granules or papules** of vulvar mucosa
- Mucopurulent discharge

- **Granules & papules**

### DDx:

- **IPV** (Infectious pustular vulvovaginitis) (p 117)

- **Subside spontaneous** (10-14 ds)
- Sexual rest - 2 weeks
- AI

Papules in vulva  
Spontan. cure

## Infectious pustular vulvovaginitis (IPV) IBR

Mk 730, C3T 773; IM 253;  
BR 1061; VC/T 311

\*\*

- **Herpesvirus 1** (IBR - infectious bovine rhinotracheitis)
- Resp. & genital forms of diz
- Rarely occur together
- Abortion rarely follows genital form
- Transm. by coitus & mechanical
- **Spreads rapidly through herd**
- Genital carriers

- **Mucopurulent discharge**
- **Pustules to ulcers** (3 mm) vulva & penile mucosa
- Infertility due to reluctance to breed
- Fetid, watery, reddish discharge
- **CS subside in 10-30 days** (transient immunity)

### DDx:

- Granular vulvitis (less severe) (p 117)

- Hx & CS usually
- **M/ do virus isolation**

- **Spontaneous recovery** (Tx not required)
- Sexual rest 3-4 weeks
- Oily AB ointment (2° bact)

- Prognosis:
- **Excellent**

### Prevention:

- IBR vaccine before outbreak (not effective in face of outbreak)
- AI, need to be free of virus

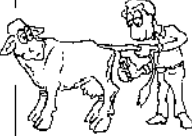

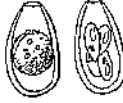

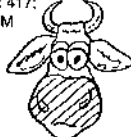

IBR

Spontaneous recovery

# Abortions

# REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment

## Actinomyces pyogenes

VC/T 357

\*\*\*

- Common cause of abortions
- Maternal bacteremia presumed cause

- Abortion at any stage of gestation
- Most in late gestation
- ± Retained placenta

- Isolate in nearly pure culture from abomasal contents of fetus
- R/O other causes
- Placentitis & bronchopneumonia most common lesions

- Control measures impractical because of sporadic nature of abortions

## Misc. bacterial abortion \*\*\*

IM 1558, 1580; Br 471; VC/T 357

- Miscellaneous bacteria together cause a high percentage of abortions; Salmonella spp., C. fetus, E. coli, Pasteurella spp., Pseudomonas spp., Haemophilus spp., Serratia marcescens, Staph. spp., Strep spp., Yersinia pseudotuberculosis. Maternal bacteremia presumed cause
- CS, Dx & control similar to A. pyogenes

## Bovine Campylobacteriosis, Vibriosis

Mk 660; VC/T 354; CST 512; 784; C2T 789; IM 1556; BR-hb 349; BR 822; Br 462, 471; DC 337; R-I, 263, 266

\*\*\*

- **Campylobacter fetus, sp. venerealis**
  - Obligate parasite of bovine genital tract, doesn't affect other species
  - Gr. neg. curved or spiral rod, motile (polar flagellum)
- **Infertility (EED - early embryonic death)**
  - Sporadic abortions at 5-6 mo
- **Transm. - coitus**
- **Subclinical carrier bulls** (crypts of prepuce)
  - Pregnant carriers
- **Pathophysiology**
  - Vaginal infec. (mucopurulent endometritis), also cervix, uterus & uterine tube
  - Persists for 2-3 mo
  - Prevents conception or EED (early embryonic death), resorption
  - Irregular returns to estrus
  - Less common abortion up to 8 mo of gestation
- Problem in replacement heifers

- **1° temporary infertility** (esp. replacement heifers) due to EED
- Repeat breeders
- Irregular estrus cycles
- Hi % returning to estrus
- Prolonged interestrus periods
- Calving late (bec. repeat breeders)
- Thin, overworked bull
- Unobserved herd: 1st clue different stages of pregnancy
- **2° abortion, low incidence** (< 5% of herd) anytime (between 4-6 months)

DDx (impossible w/o lab):

- Trichomoniasis (p 220)

- **History, CS**
- **Demonstrate or isolate org.**
  - Darkfield microscope
  - Curved rod w/ darting corkscrew motility
  - Culture from placenta or fetal abomasal content
  - Inoculate Clark's media (immediately)
  - 72 hr for results
  - No contamination or overwhelmed
- **Mucus agglutination test**
- Survey herd for infection
- **Swab & culture penis & preputial mucosa**
  - Difficult bec. org. slow growing & often overwhelmed by saprophytes

- **Recover spontan. w/in 5 mo**
  - Resist reinfection then
- Intrauterine infusion hastens recovery
- **Vaccinate infec. cow**, booster in 6-8 weeks, booster 1 mo before breeding (dramatically improves fertility)
- **Bull: dihydrostreptomycin** in oil base & massage up into prepuce

### Prognosis: Good

- Spontaneous recovery & resist reinfection
- Severe endometritis or salpingitis infertility m/b permanent

### Prevention

#### • Vaccination

- Heifer - killed bacterin 1 month before breeding, booster 2 weeks later (IM) ≥ 4 wk (Mk)
- Bull vaccinate w/ 2.5 X cow dose repeatedly to prevent carrier state
  - Need 6 neglar cultures to be considered free
- Revaccinate bulls & cows annually
- AI from noninfected bulls or treat semen w/ streptomycin
- **AI (artificial insemination) exclusively controls diz by preventing transm.**

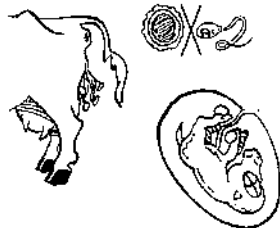

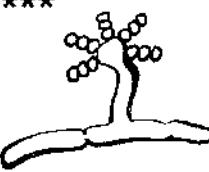

**Herd infertility (EED), Carrier bulls**  
**CS: Repeat breeders, Low % abortion**  
**Dx: Isolate**  
**Tx: Recover in 5 mos. • AI, Vaccinate**

## Bovine viral diarrhea abortion

Mk 166, C3T 432; IM 1552; Br 492; R-M 254, 298

\*\*\*

- Multisystem viral diz, GI, Resp., Abortion, Mucosal disease
- **Togavirus**
- **Cytopathic & noncytopathic biotypes**
- Immunosuppressive w/ predispose to other diseases
- **Transmission:**
  - Direct contact w/ sick or carriers
  - Indirect from contaminated material
  - **Transplacentally**
- Worldwide
- 1° yearlings, up to 2-3 years
- Pathophys. of repro. infections
- **Prevents conception** if infec. at breeding
- **1st 4 months = fetal death & abortion** (usually)

1. Majority - usually unobserved systemic infect.
2. Classical BVD - Gastroenteritis
  - Diarrhea, oral erosions, recover in 10 ds
3. Respiratory signs w/ fever, recovery in 10 ds
4. **Transplacental infection**
  - **Abortion** - any stage (1-4 months)
  - **History of repeat breeding** (no conception, fetal absorption)
  - **"Weak calf" syndrome**
  - **Dysplastic lesions**
  - Teratogenic effects (cerebellar hypoplasia, ocular defects) or
  - Persistently infected & develop **mucosal diz** later if infection w/ cytopathic BVD virus
5. Mucosal disease (chronic BVD)
  - 100% fatality, Oral erosions, lameness
6. Cerebellar hypoplasia (see pg 124)

- **Difficult to Dx**
- **Mummified or**
- **Dysplastic lesions** (cerebellar hypoplasia or dysplasia, hydrocephalus, microencephaly, retinal dysplasia, spinal dysmyelination, brachygnathia, alopecia, bronchiolar dysplasia, arthrogryposis, cataracts, optic neuritis)
- Mild nonsuppurative placentitis (histo)
- **Viral isolation** from fetal tissue seldom successful
- **FA, ELIZA**

## Prevention & control

- **Vaccination** - good for dairy herds & beef cow/calf operations, questionable for feedlots
- **Screening & elimination** of persistent infected cattle (see box)

**Prognosis:** Breeding back: good to excellent

## MLV vaccine (MLV):

- Not in pregnant cows - fetopathic
- **Killed vaccine (KV):**

- Most recommend killed vaccine at 6 mos
- Only use killed in pregnant

## Vaccination schedule:

- 1° immunization 2 wks - booster; Annual revaccination

## Breeding farm

- Vaccinate all breeding-age cattle
- Vaccinate nulliparous heifers between 6 -14 mos twice (KV)
- Goal is to reduce losses, not eliminate infec. agent

## Multisystem diz

**CS: Repro (Abortion, Repeat breeders, Weak calf)**

**Dx: Mummy, Dysplastic**

**Control: Vac. , Screen & Eliminate •Px: Fertility OK**

## Leptospirosis abortion

Mk 353, 356, 1085; VC/T 352; C3T 541; IM 1558; R-M 267, 298; VC/T 352; T 267; Br 471

\*\*\*

- **Leptospira harjo** #1 (*L. pomona*, *L. canicola*, *L. interrogans*, etc.)
- Abortion weeks-mos after infection
- Abortion < 10%
- Ubiquitous, persistent infections
- Shed in urine & pass through abraded skin
- **Public health** - infective to man, caution

## Infertility, Abortion outbreaks

**Tx: Vac (MKV) in outbreak, Oxytetracycline**

**Vaccine 2-12 mos**

## Screening to eliminate persistent infections

& clean up a herd

- Vac. all over 6 mo twice (KV)
- Serum neutralization titers on all 1 wk after 2nd vaccine
- Seronegative or low titer cattle (naive or persistent shedders) - virus isolation
- If virus present, but no antibodies, they are persistent shedders - cull
- Repeat in calves less than 6 mos when they reach 6 mos old
- Test calves born 7 to 8 mos after screening program

- **Calves** - fever, anorexia & dyspnea
- **Older cattle**
- Drop in milk production for 10 ds
- **Infertility**
- **Abortion** (4 mos to term, esp 3rd trimester)
- **Birth of weak or dead calf**
- Icterus, hemoglobinuria, agalactia, fever
- Frequent abort w/o CS

- **Difficult**
- **FA of fetal kidney**
- **Maternal serology**
- **Bacterial isolation impractical**

## DDx:

- Brucellosis (p 122)
- Campylobacteriosis (p 119)
- Trichomoniasis (p 120)

- **Abortion outbreak**
- Vac. herd w/ killed bacterin
- **Oxytetracycline** (m/b limited to sick cows in dairy herd)
- Isolate aborting cows & Tx w/ streptomycin if not destined for slaughter
- Remove aborted fetuses & placentas from premise

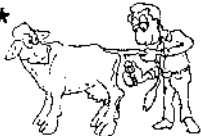

## Vaccine:

- **6-12 month intervals** or more frequent in bad areas

# Abortion

# REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Brucellosis, Bang's disease, Contagious abortion, Brucella abortus</b> Mk. 667; C3T 551; C2T 791; M 1555; BR 787; Br 471, 476; JC 482; L 117; R-M 271, 296 <b>★★</b> 	<ul style="list-style-type: none"> <li>• <b>Brucella abortus</b>, gram negative coccobacilli</li> <li>• <b>Contagious diz</b> (spreads rapidly in unvaccinated herd w/ many abortions)</li> <li>- <b>Cows only abort once</b></li> <li>• Cattle &gt;&gt;&gt; sheep, goats, pig &amp; dogs</li> <li>• Incidence in USA 0.2% in 1999; 2/3rds of USA Brucella free</li> <li>• <b>Transmission</b></li> <li>- 1° <b>Ingestion</b></li> <li>- Organism shed in milk &amp; uterine discharges</li> <li>- Venereal transm. rare</li> <li>- Brucella m/ enter body through mucous membranes, conjunctiva, wounds or even intact skin</li> <li>- Mechanical vectors (including man)</li> <li>• <b>Public health - undulant fever</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Abortion</b> (after 5th months)</li> <li>- Stillborn calves</li> <li>• Reduced milk yield</li> <li>• Healthy cow</li> <li>• Bulls: seminal vesicles, ampullae &amp; epididymides &amp; testes</li> <li>• Sequelae</li> <li>- Retained placenta</li> <li>- Mastitis</li> <li>- Lameness</li> </ul>  	<ul style="list-style-type: none"> <li>• <b>Culture of B. abortus</b> from fetal lung, abomasum, or placenta, uterine or mammary secretions</li> <li>• Standard plate or tube serum agglutination test</li> <li>- <b>1:100 agglutination</b> - unvac.</li> <li>- 1:200 for vaccinated animals</li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Report to State &amp; Feds</b></li> <li>• <b>Quarantine &amp; slaughter</b> all reactors in herd diagnosed positive to brucellosis</li> </ul>

## Epizootic bovine abortion (EBA), Foothill abortion

Mk 854; C3T 455; IM 1554; BR 794; DC 339; R-M 260, 298; VC/T 363

- Late abortn. in foothills of Calif.
- Cause: ? Not *Chlamydia psittaci*
- Tick (*Ornithodoros coriaceus*) vector
- Calif, Nevada, Oregon, N. Mex.
- Pathophysiology
  - Transformation & proliferation of fetal lymphocytes & macrophages
  - IgG & IgM elevated
  - **90 days for fetal lesions** (so no abortion if infection after 6 months)

- Late abortion (6-7 months) or
- Weak calves (especially from heifers)
- Cows show no CS

- Hx (tick), CS
- Postmortem:
  - Enlarged spleen
  - Pathologic exam of fetus
  - **↑ IgG in fetal blood**
  - **No serologic test because agent unknown**

- **Chlortetracycline** reduces rate of abortion

### Chlortetracycline

#### Prevention & control:

- Seldom abort in subsequent pregnancies
- No vaccine
- Expose heifers to tick before breeding
- Change from spring to fall calving (reduces exposure to tick only during last trimester)

### Cause? Tick vector

**CS: Late abortions, Weak calves, Cows OK**

**Tx: Chlortetracycline reduces abortion**

## Ureaplasma

IM 1562; BR 906; R-M 282, 298; VC/T 357; T 282

- Infection common, abortion - rare; Small bacterium w/o cell walls, ability to hydrolyze urea differentiates it from mycoplasma, Assoc. w/ granular vulvitis & abortion in cattle
- CS: Reddish nodules in vulvar mucosa, mucopurulent discharge, not systemically ill, abortions
- Dx: Isolate organism from genital mucosa, placenta or fetal stomach or lung
- Tx: Tetracycline infusions of uterus

## Sarcocystis

IM 1563; BR 1191; VC/T 351

- See Gen 261; *Sarcocystis cruzi* (protozoan); carnivore - cattle life cycle, ingestion of carnivore feces, protozoa usually encysts in muscle w/ no CS
- CS: most cattle infec. w/ sarcocystis, but show no CS of infection; depression, anorexia, wt. loss, lameness, hair loss, death; abortions in late gestation
- Dx: FA of protozoa in cotyledon or caruncle
- Tx: none developed • Control: keep canine or feline feces away from cows, & don't let carnivores eat placenta, aborted feces or ruminant carcasses

Toxoplasmosis (IM 1568; BR-hb 461, BR 1201; Br 245) • *Toxoplasma gondii* (protozoan) Abortion not well documented in cattle, not important cause, but a rule out

## Mycoplasma

IM 1560; DC 336; R-M 288; T 288

★★

- *Mycoplasma bovis*, *Mycoplasma bovigenitalium* common in genital tract. Transmission m/b venereal
- CS: Infertility more common than abortion, Abortion, Granular vulvovaginitis, endometritis
- Dx: Placentitis & fetal pneumonia, **Isolate Mycoplasma** from genital tract, milk, placenta or fetus (not diagnostic), Eliminate other causes
- Tx: **Tetracycline or Tylosin**

Chlamydial (VC/T 364; R-M 279) • Experimental abortion, not sure if natural

**Bluetongue** (IM 1552; R-M 258, 298; VC/T 351) • Infection common, but fetal infection rare, if fetus infection - CNS teratogenic (hydroencephaly), fetal death, mummification or abortion

## Bovine protozoal (Neospora) abortion

IM 1565; DC 339; VC/T 359

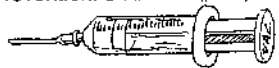

- **Newly recognized, Neospora** (protozoa similar to *T. gondii*), Major problem in California, 4-6 mo (3-9) of gestation, Transmission unknown
- CS: Sporadic, multiple or storms of abortions, Only clinical sign, Year round abortions, Occasional live calves w/ protozoal encephalomyelitis. CNS: dysfunction, limb paresis, unable to stand, BAR, m/ live several wks w/ supportive Tx
- Dx: Hx, CS, PM: Fetuses - autolyzed, Histopath of fetal brain
- Tx: No effective Tx • Control: Difficult bec. life cycle & mode of transmission unknown

# Pregnancy Related Conditions

# REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>BVD - Cerebellar hypoplasia</b>  CST 859; IM 1103; BM&S 1023 **	<ul style="list-style-type: none"> <li>• See Gen pg 253</li> <li>• BVD infec. of pregnant cows</li> <li>- 100-170 days - congenital cerebellar hypoplasia</li> <li>- 90-100 ds - abortion or stillbirth</li> </ul> 	<ul style="list-style-type: none"> <li>• At birth - "Weak calf" syndrome</li> <li>• Truncal ataxia</li> <li>• Opisthotonus</li> <li>• Base-wide stance</li> <li>• Intentional head tremors</li> <li>• Hypermetria, hyperreflexia</li> <li>• Nystagmus or strabismus</li> <li>• Deficient menace response (not blind unless ocular malformation)</li> <li>• Other signs - corneal opacity, thymic atrophy, microphthalmia, retinal degeneration</li> </ul> 	<ul style="list-style-type: none"> <li>• Hx, CS</li> <li>• BVD antibodies in precolostral blood</li> </ul> 	<ul style="list-style-type: none"> <li>• None</li> </ul>  <b>Prognosis:</b> <ul style="list-style-type: none"> <li>• Grave - rarely improves</li> </ul> <b>Prevention:</b> BVD vac. (p 252) 
<b>BVD - Pregnant cow</b> <b>CS: At birth - Ataxia, Wide-based, Tremors</b> <b>Tx: None • Px: Grave</b>				

**Bluetongue** can also cause cerebellar hypoplasia

## Miscellaneous CNS genetic conditions

- See Neuro pg 135, Cerebellar abiotrophy, Hydrocephalus, Inherited congenital myoclonus, Occipito-atlantal malformation, Dodder calves, Progressive ataxia, Spinal bifida, Cerebellar malformations, Arnold-Chiari Syndrome, Weaver Syndrome, Bovine familial convulsions & ataxia, Maple syrup diz, Inherited congenital myoclonus

## Other genetic defects

- Disorders of hemostasis (pg 84); Pink tooth (pg 91); Heart defects (pg 79); Skin dzs (pg 191); Hermaphrodite (pg 113); Segmental hypoplasia of repro. tract (pg 113) Eiso heel (pg 137); Freemartin (pg 107), Ovarian hypoplasia (pg 108)

## Postparturient hemoglobinuria

- See pg 88; High producing dairy cattle 2-4 wks after calving; Cause: unknown, Hypophosphatemia
- CS: Intravascular hemolysis => hemoglobinuria & anemia; icterus
- Dx: Hx, CS, Red urine, Regenerative anemia, Low phosphorus levels in blood
- Tx: IV fluids, Phosphorus supplementation
- Px: Severely affected don't respond

**P+**

## Poisonous plants

Br 473

- See Tox pg 241: **Abortions:** Locoweed, Wild tobaccos, Nitrate/nitrite poisoning, Pyrrolizidine alkaloid
- **Broomsnakeweed, Oak poisoning, Ponderosa pine**
- **Teratogenic plants:** Lupine & Poison hemlock (p 241) " Crooked calf diz" as in lupine toxicosis
- **Zearalenone:** Rare; Estrogenic chem. (mold), Natural contamination of ear corn stored in cribs, Cattle more resistant than swine
- CS: Reduced conception rate

## Fat cow syndrome

- See GI pg 32; Diz of fat dairy cows that have just calved (1-3 ds)
- CS: Anorexic, Severe ketonuria, Recumbency, CNS, Terminal tachycardia & coma
- Dx: Hypoglycemia, Ketones, Liver biopsy, if high lipid (> 35%) floats
- Tx: IV glucose, Oral propylene glycol, Results are poor
- Px: Poor • Control: don't allow to get fat during dry period

## Ketosis, Acetonemia, Ketonemia

- See GI pg. 33; Diz of dairy cows at peak lactation (3 ds post calving, hi energy demand - low energy)
- CS: Wasting & CNS
- Dx: Ketones, Tx response
- Tx: Glucose + steroids + propylene glycol + feed
- Px: Rarely die

## Pregnancy toxemia

- See GI pg. 32; Rare diz of fat pregnant beef cows - no feed last 2 mo, twins (more common in sheep)
- CS: Recumbent & die before calving
- Dx: Ketonuria - fatty liver
- Tx: Too late usually, Induce parturition
- Px: Grave, most die

## Postparturient paresis, Milk fever

- See Card. pg. 148; Adult high prod. dairy cows (Jerseys), 0-72 hr after birth, Drain of Ca to milk, Hypocalcemia (release of ACh at NMJ)
- CS: Early - Wobbly standing, bellowing, Downer cow (head turned to flank); Lat. recumbency as approaches coma
- Dx: Hx, CS, Lab analysis
- Tx: Watch postpartum for 72 hrs, Early IV Ca gluconate (SQ or IP) Repeat in 8-12 hrs, IV phosphorus
- Px: Untreated - coma die; Down > 48 hrs - myositis, m/ never be able to stand
- Prevention: Lower Ca intake during dry period (just hay) Vit. D, High doses of Ca 1 d before, at, & 1 d after calving

## Calving paralysis

- See Neuro pg. 137; Obturator & sciatic nerves, Dystocia (calf damaging obturator & ischiatic nerves on way through canal)
- CS: Splay leggedness, "Splits", Recumbency w/ hind legs to each side
- Dx: Hx (just calved)
- Tx: Keep on firm ground, no slippery surfaces, Tie hocks together just prox. to calcaneus, Hope function returns

## Downer cow

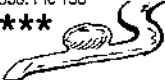

- See Gen pg. 267; Most common sequel to recumbency of parturient paresis, other causes: bone, muscle or nerve damage, Systemic illnesses, Trauma & lymphosarcoma, metabolic disorders 2° to milk fever
- CS: Unable to rise 24 hrs, "Creeping" or "crawling"; Nonalert downer cows
- Dx: R/O, Tx milk fever, Rectal exam, CK & AST; PM: degeneration of muscles & nerves of hindlimb
- Tx: Good footing, Retreat milk fever, Phosphorus, Stimulate to rise, if all fails - supportive care
- Px: Good if gets up (obviously) Many will rise w/in 2 wks if eating & drinking & good nursing

## Bull

## REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Penile hematoma, "Broken penis"</b> C3T 797; BM&S 479; Br 502; R-M 356; S-UG 10; S-Y 297; S-J 1042; S-O 538; Pic 158 <b>***</b> 	<ul style="list-style-type: none"> <li>• Most common injury in Bull</li> <li>• <b>Tearing of tunica albuginea</b> into corpus cavernosum               <ul style="list-style-type: none"> <li>- Transverse tear</li> <li>- Dorsum of penis at distal flexure</li> <li>- Peak thrust of coitus, corpus cavernosum pressure is 100X arterial pressure</li> </ul> </li> <li>- <b>Explosion of blood</b> into surrounding tissue, damaging elastic tissue around penis</li> <li>• <b>Disease of inexperienced, over exuberant male, catches penis, bending it</b></li> </ul>	<ul style="list-style-type: none"> <li>• Pain &amp; stiffness</li> <li>• <b>Swelling just cranial to scrotum</b></li> <li>• Dark purple prepuce</li> </ul>  <ul style="list-style-type: none"> <li>• Sequelae:           <ul style="list-style-type: none"> <li>- <b>Prolapse of prepuce</b></li> <li>- Abscess if infected</li> <li>- Damage to sensory nn. on dors. aspect, numb end of penis</li> <li>- Adhesions, restriction</li> <li>- Acquired vascular shunts between corpus cavernosum &amp; dors. veins, erection impossible</li> </ul> </li> </ul> <div style="border: 1px solid black; border-radius: 15px; padding: 5px; width: fit-content; margin: 10px auto;"> <b>DDx:</b>  <ul style="list-style-type: none"> <li>• Laceration of prepuce</li> </ul> </div>	<ul style="list-style-type: none"> <li>• <b>Hx, CS: Swelling</b></li> <li>• Paracentesis w/ large needle into clot gives biopsy</li> </ul> 	<p><b>1• Conservative Tx:</b> </p> <ul style="list-style-type: none"> <li>- Systemic antibiotics</li> <li>- Ice, hosing w/ water</li> <li>- Massage moving skin back &amp; forth</li> <li>- <b>#1 sexual rest - 3 months</b></li> </ul> <p><b>2• Sx: 1-2 days after injury</b> </p> <ul style="list-style-type: none"> <li>- Remove hematoma digitally</li> <li>- Suture tear</li> <li>- <b>2 months sexual rest</b></li> <li>- NSAIDs</li> <li>- Antibiotics</li> </ul>   <p><b>Prognosis:</b></p> <ul style="list-style-type: none"> <li>• <b>Guarded</b>, Dep on #1 size, abscesses, nerve damage, adhesions or vascular shunts</li> </ul>
<b>Torn tunica albuginea</b> <b>CS: Swelling cran. to scrotum</b> <b>Dx: Needle biopsy</b> <b>Tx: Sexual rest, ABs, Ice; Sx</b>				
<b>Phimosis</b> IM 1566; S-O 528; S-UG 38 <b>**</b>	<ul style="list-style-type: none"> <li>• <b>Inability to protrude the penis</b>, Causes: sequel to injury &amp; scarring (cicatrix formation), contusions, lacerations, abrasions, frostbite</li> <li>• <b>CS &amp; Dx:</b> inability to protrude penis</li> <li>• <b>Tx:</b> Minor injuries m/ resolve spontaneously; Hygiene: clean preputial cavity daily &amp; infuse w/ hydrogen peroxide, Infuse oily antibiotics; Broad spec. ABs systemically; If prepuce prolapsed, protect w/ bandages &amp; hold in place w/ purse string suture, Sx removal of scar tissue m/b necessary after healing complete</li> <li>• <b>Px:</b> depends on severity of injury</li> </ul>			
<b>Paraphimosis, Penile prolapse</b> <b>***</b> IM 1566; S-UG 43	<ul style="list-style-type: none"> <li>• <b>Inability to withdraw penis into prepuce</b>; Causes: <b>trauma</b>, tumor, denervation, rabies</li> <li>• <b>CS &amp; Dx:</b> Protruded traumatized penis, edema, swelling &amp; balanoposthitis, Surface of penis dry, thickened &amp; inelastic</li> <li>• <b>Tx:</b> Prompt Tx to reduce swelling &amp; edema &amp; return to prepuce, Freq. cleaning &amp; oily AB soaked bandages, Support penis next to body, Return to prepuce as soon as possible, pack sheath w/ petroleum jelly to prevent adhesions</li> <li>• <b>Px:</b> Poor if can't retract penis in a few days</li> </ul>			
<b>Priapism</b>	<ul style="list-style-type: none"> <li>• Persistent erection w/o sexual arousal</li> </ul>			

## Preputial prolapse

Mk 672; C3T 797; IM 240; 1760; T 141; BM&S 1187; R-M 363; S-UG 38; S-O 531, 529; Pic 158

\*\*\*

- **Pendulous prepuce**
  - Bos indicus, Zebu, Brahmas, Santa Gertrudis (common problem)
- **Trauma (contusion &/or laceration)**
  - Edema causes preputial prolapse
  - If attempt coitus, splitting on ventrum of prepuce

- **Collar of pink mucosa** hanging out
- **Trauma** exacerbates problem
- **Trouble urinating** if swollen

- **Pink mucosa out prepuce**
- **Clean & evaluate** for viability

- **Conservative Tx**
  - Clean w/ lanolin ointments
  - Push soft rubber hose (fits around penis) up into prepuce, push mucosa back
  - Bandage prepuce 
- **Circumcision** (see box)

### Circumcision - if traumatized & not viable

- permanent cure
- Done similar to rectal prolapse Sx
- Use squeeze chute
- Use ring block around prepuce
- Overlapping mattress sutures hold 2 layers together
- Cut off excess
- 2 mucosal edges apposed & sutured
- Place tubing around penis & bandage
- Leave bandage 10-14 days
- Sexual rest for 30 days

**Pendulous prepuce, Trauma - Coitus**  
**CS: Pink mucosal protrusion**  
**Tx: Bandage, Circumcision**

## Balano-posthitis

C3T 797; IM 1568; Br 486, 502

\*\*

- **Inflammation of glans penis (balanitis) & prepuce (posthitis);** Causes: Trauma, **Hair ring** (smegma matted) around preputial orifice or penis, Herpes virus 1, **IBR/VP**
- **CS & Dx: Stenosis of preputial orifice, adhesions betw. penis & prepuce, Pain, Copulation avoided**
- **Tx: Spontaneous usually; Symptomatic, Sexual rest, Sx removal of hair rings**

## Penile deviation

Mk 672; C3T 797; IM 240; T 141; BM&S 1181; R-M 359; S-UG 20; Pic 157

\*\*

- **Dorsal apical ligament**
  - Fans out over dorsum of penis
  - Just dorsal to tunica albuginea
  - Normally causes ventr. bend & counter-clockwise spiral
- **Deviation: if dors. lig. slips off to lt. & causes corkscrew appearance to penis during erection**
- **3-4 year-old, highly fit bulls**

- **Deviation of penis (ventral or spiral)**
- **Can't breed**

- **Hx, CS**
- **Observe bull trying to breed unsuccessfully**

- **Stabilize by suturing down dors. lig.**
  - Usually not enough alone due to excessive force
- **Shortening dorsal ligament**
- **Homologous graft of fascia lata betw. tunica albuginea & ligament**

**Dors. apical lig., Adult bulls**

**CS: Spiral or ventr. deviation**

**Tx: Sx shorten lig. or Fascia lata graft**

**DDx:**

- **Persistent frenulum**

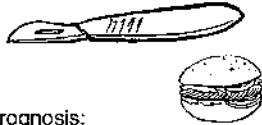

**Warts, viral papillomas** (C3T 796): See Skin pg 190; Freq. on penis, but not on prepuce • **Tx: Surgical removal preferred over thermocautery (deep necrosis)**

# Male

128

# REPRODUCTION

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Persistent frenulum **</b> Mk 673; Im 240, 1760; Br 502; C3T 796; BM&S 1186  <b>Congenital, Hereditary</b> <b>CS/Dx: Ventr. deviation of penis</b> <b>Tx: Cut; Cull in purebred herds</b>	<ul style="list-style-type: none"> <li>• Congenital fibrous band from tip of penis to prepuce</li> <li>• Highly hereditary</li> <li>- Few blood vessels in band</li> <li>• Inherited - recessive?</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Ventral deviation of penis</b></li> <li>- Noticed when coitus attempted</li> <li>- Rarely is entrance accomplished</li> </ul> 	<ul style="list-style-type: none"> <li>• Hx (young)</li> <li>• Ventral deviation during attempted coitus</li> </ul> <p><b>DDx:</b></p> <ul style="list-style-type: none"> <li>• Penile deviation</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Surgically cut band</b></li> <li>• <b>Cull in purebred herds</b></li> </ul>  <p>Prognosis:</p> <ul style="list-style-type: none"> <li>• Good - able to breed in 2 weeks</li> </ul>

**Dorsal laceration of penis (VOT 796):** m/ interrupt sensory nerve supply essential for intromission & ejaculation • Dx: Attempt to mate, scars • Tx: none

## Tumors of penis & prepuce \*\*\*

IM 1569

- Fibropapilloma most common, single or multiple, usually young bulls; Cause: papilloma viruses through epithelial damage
- CS: small - none; Large: m/ prevent withdrawal of penis into prepuce, hemorrhage (friable)
- Tx: Many spontaneously regress in a few months (most likely in bulls approaching 2 yr-old), Vaccines, Sx removal (recurrence common); Sx amputation
- Control: Vaccinate

## Testicular hypoplasia

IM 1571, 1759t; BR-hb 631; BR 1627; Br 152, 504, 491; C3T 796  
**\*\*\***

- Aplasia - rare (complete absence of 1 or both testicles)
- **Hypoplasia** unilat. or bilateral, both scrotal or abdominal testicles; Cause: transplacental infec. or intoxication, hormonal insufficiency, Zinc defc, impaired testicular descent, vascular disturbances, abnormal karyotype
- **CS & Dx:** Small testicle; scrotal circumference normally at least 32 cm at 12 months old, ejaculates m/b azoospermia or low # of sperm w/ numerous morphologic defects
- **No successful Treatment**

## Testicular degeneration, Heat injury

IM 1571; C3T 795; Br 491, 504  
**\*\*\***

- **↑ Temperature** (cryptorchid, ectopic testes, inguinal hernias), Systemic diz temporary infertility due to hi temp., Prolonged high environmental temp. + high humidity; Torsion of spermatic cord, scrotal edema, obstruction of epididymis, steroids
- CS: Small testicles
- **DDx:** Testicular hypoplasia (hard to DDx)
- **Dx:** PE & semen exam; US, testicular biopsy last resort bec. of hemorrhage & pressure necrosis
- **Tx:** Remove cause, Sexual rest • **Px:** If temporary, improved semen in 4-5 months

## Castration, Orchiectomy

R-M 373; S-UG 62; S-J 1062; S-T 289

- Common procedure in feedlot animals
- Animal standing in chute & tailed up for restraint
  - Skin incision
    - . Small calves: remove bottom third of scrotum w/ a scalpel
    - . Larger cattle: scalpel or Newbury knife incise from above testicle to distal scrotum
  - Pull out testicle surrounded by vaginal tunics (closed castration)
  - Emasculator high on spermatic cord
    - . "Nut to nut" of emasculators, make sure cutting edge is distal to crushing
    - . **Maintain crush for 1-2 minutes**
  - Leave wound to granulate in
- Emasculator can also be used, it doesn't leave a wound

## Cryptorchidism

IM 1571, 1759; BR-hb 632; BR 1653; Br 152; S-J 1065

- Most are located in SQ tissue near inguinal ring, occasionally testicle lies transversely in scrotum rather than in normal vertical position, true abdominal cryptorchidism is rare
- Tx: Abdominal cryptorchid: any laparotomy incision, locate testicle between inguinal ring & kidney

## Testicular neoplasia

IM 1572

★★

- 1° rare. Interstitial cell (Leydig cell) tumors (don't produce hormones usu.), seminomas
- CS: Enlarged testicle, ↓ sperm count m/b, fertility m/ not be affected
- Tx: Unilat. surgical removal (wait until end of breeding season if semen quality OK)  
Bilateral: wait until semen quality falls to negate use in breeding, then remove

## Acute orchitis

IM 1572; C3T 795

★★

- Inflammation of testicles
- Small % of males
- Unilateral
- Cause: trauma or infec. (*Brucella abortus*, *Mycobacterium tuberculosis*, *Actinomyces pyogenes*, *Nocardia farcinica*, bovine herpesvirus III (IBR/IPV))

- Hot, swollen, painful testicle
- Refuse to mate
- Chronic: testicular atrophy, fibrosis & sterility

- Palpation of testicle
- US (ultrasound)
- Ejaculate (WBCs, decr. motility & incr. morphological abnormalities)

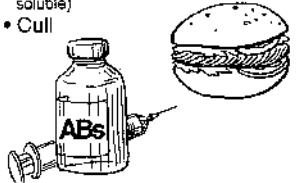

- Sexual rest
- ABs IV (C&S - culture & sensitivity) 1-2 weeks past resolution of pain
- NSAIDs
- Cold hydrotherapy (30 min BID) reduces inflammation

Infec. or Trauma - IBR  
CS: Hot, painful testes  
Tx: Cold Tx, Rest, ABs

**Bull Infertility:**  
See pg 289

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Varicocele</b> IM 1573; C3T 794 ★★</p>	<ul style="list-style-type: none"> <li>• <b>Abnormally distended &amp; tortuous veins of pampiniform plexus</b>, Backflow &amp; stasis in veins, infertility causes disturbances in thermoregulatory mechanism (counter current heat exchange between hot artery &amp; cool veins, keeping testicle temp. down)</li> <li>• <b>CS &amp; Dx: Nonpainful "bag of worms" w/in spermatic cord</b></li> <li>• <b>Tx:</b> If thrombosis: unilateral castration (transect spermatic cord prox. to thrombus)</li> </ul>

**UMN & LMN CS:** helps differentiate peripheral from central lesions; & if central, helps localize level of the lesion

- **LMN CS** to area innervated by damaged spinal cord segment (not UMN CS bec. UMN requires intact LMNs)
- **UMN CS** caud. to damage spinal cord segment

Degree of signs depends on amount of damage to spinal cord (white &/or gray matter)

**LOWER MOTOR NEURON (LMN):** motor part of reflex arc to muscles or glands (peripheral nerves). Spontaneously active w/out input of UMN

**LMN damage:** (periphery or cell body in CNS) (thumbs down)

- **Flaccid paresis or paralysis** ("limp as a dish rag")
- **Tone - ↓ to none** (hypotonia - atonia)
- **Reflexes - ↓ to absent** (hyporeflexia - areflexia)
- **Fast atrophy** (neurogenic atrophy) w/in 1 wk

**UPPER MOTOR NEURON (UMN):** CNS neuron affecting LMN (peripheral or cran. nerves). Initiates & maintains conscious movements & provides tone to extensor muscles (posture). Excitatory UMN (inactive until needed) & inhibitory UMN (constantly keep LMN under control)

**UMN damage:** (thumbs up) loss of ability to initiate voluntary motor activity & possibly uncontrolled hyperactivity of LMNs due to decr. inhibition

- **Tone - normal to ↑**
- **Reflexes - normal or ↑** (normoreflexia or hyperreflexia)
- **Spastic paresis or paralysis**
- **Slow disuse atrophy**
- **Extensors facilitated** (extended limb)

## Lesion localization - NS (From Dr. Charles Hutchison's lectures; BR 459)

**SHIFF-SHERRINGTON SYNDROME:** hyperextension of the forelimbs w/ lesions to thoracic spinal cord, removal of ascending inhibition (bad prognostic sign, serious spinal cord lesion)

**Proprioception loss:** usually 1st CS in spinal cord compression  
For localization, interpreted the same as LMN/UMN

- **Ataxia**
- **Postural deficits** (wide base stance, knuckle over)
- **Delayed initiation of movement**

**Superficial pain loss:** lost at same time as motor function is lost. If superficial pain perceived, will also have deep pain. (A withdrawal reflex DOES NOT require perception of pain.)

**Deep pain:** 1st to show & last to disappear ("first to show, last to go"). Loss of deep pain a bad prognostic sign. Evaluated only when superficial pain is absent.

**Cutaneous trunci reflex** or panniculus reflex: a normal twitching of cutan. trunci m. to stimuli. Sensory fibers from lat. wall dermatomes pass craniodorsally to thoracolumbar spinal cord segments (1 or 2 vertebrae cranially). Ascending sensory tracts extend up the spinal cord to lat. thoracic n. (C8) which innervates cutan. trunci muscle.

- **Panniculus absent** localizes to 1 - 2 vertebrae caud. to spinal cord lesion

**Hyperesthesia:** abnormal increased sensitivity. Spinal cord segment lesions cause a focal hyperesthesia to the dermatome supplied.

**Diffuse or multifocal pain:** often due to inflammation.

**Focal pain:** often due to compression of spinal cord or nerve root.

## CS & spinal cord region damaged

### C1-5: Cervical region

- No LMN to all limbs
- UMN, propriocep. & pain defc - all limbs

### C6-T2: Cervicothoracic region

- LMN - thoracic limb
- UMN, propriocep. & pain defc - hindlimbs

### T3-L3: Thoracic & thoracolumbar region

- Normal thoracic limb (+/- Shiff-Sherrington)
- UMN, propriocep. & pain defc - pelvic limbs
- Cutan. trunci absent 1-2 vertebrae caud.

### L4-S2: Lumbosacral region

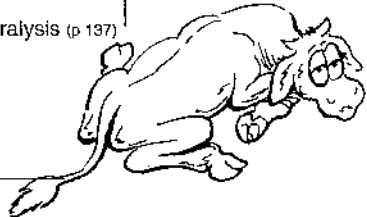

- Normal thoracic limbs
- LMN - pelvic limbs

### S3-Cd5: Sacral region (cauda equina)

- UMN - to bladder, anus & urethra (flaccid paralysis of anus, no defecation)
- Loss of sensation to tail, penis, vulva & perineum
- Distended flaccid bladder, incontinence

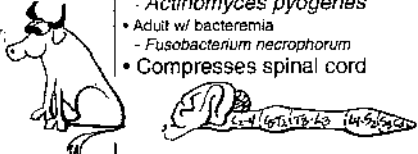

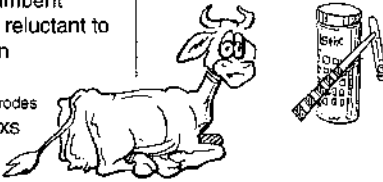

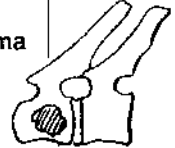

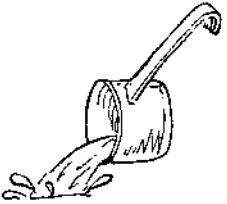

### Lesions betw. C1-S2

- UMN - pelvic region
- Anal & tail tone normal
- Bladder m/b distended, urethralis m. normal

## Lymphosarcoma of Spinal Cord

Mk 592; IM 1136; C&T 917; VC/N 186; DC 424

\*\*\*

- See Gen, pg 268
- > 5 yrs-old, Adult
- **Cauda equina** & lumbar segments of spinal cord
- **Pathophysiology**
  - Extradural
  - Compressive, usually involves white matter, unless severe

> 5 yr old - **Compression**  
**CS: CNS to rear end**  
**Dx: Difficult**  
**Tx: Euthanasia**

- Indistinguishable from spinal fx
- **Variable** (degree of compression)
- **Progressive onset**
- **Cauda equina** (common site)
  - **Flaccid tail & anus**
  - **Dysuria**, urine scalding
  - **Distended bladder**
  - **Perineal analgesia**
  - +/- **ataxia, paraparesis** (if far enough cranial, dog-sit)
- **BAR** (bright, alert, responsive)
- Other systems involved
- Cranial nerves normal, unless involvement of the eye

- **Dx difficult** unless other systems involved
- History, CS
- CSF tap: m/ biopsy tumor
- **BAR points toward this diz**
- If BLV positive, m/ support Dx
- Rads usually not helpful
- Postmortem:  Definitive diagnoses

Tumors other than lymphosarcoma are rare in cattle

- **No therapy** 
- Prognosis:**  Grave, euthanasia
- Control**

- Control vectors (blood transmission)
- Eliminate lymphosarcoma from herd by testing & culling positive animals; possible, but costly

### DDx:

- Abscesses around spinal cord
- Downer cow syndrome (p 267)
- Obturator n. damage (p 137)
- Trauma of spinal cord (p 133)
- Metabolic defic (hypocalcemia)
- Cervical spinal cord lesions
- Spinal fracture (p 133)
- Cattle grubs (p 182, 134)

## Occipito-atlanto malformation

Mk 593; IM 1142; N-L 258

\*

- Rare, Devon calves
- Developmental defect
- Spinal cord compression
  - Lesion to LMN & conscious proprioceptive pathways

- Focal spinal cord CS
- M/b dead at birth
- Ataxic at birth or in few wks
- Difficulty bending head to suckle
- Torticollis ("wyneck", twisted neck)
- Symmetric LMN CS (Cervical)
  - #1 tetraplegia or tetraparesis
  - Proprioceptive deficits (ataxia)
  - Hyperreflexia & hypertonia

- M/b palpate malformation axis
- Rads - definitive Dx

### DDx:

- Normal awkwardness at birth
- SEE DDx for spinal trauma

- None

## Miscellaneous genetic conditions (BR-hb 213,630; BR 503; C&T 92)

**Dodder calves** (IM 1148; BR-hb 643; BR 1647; Br 698) • Rare, congenital, lethal in Jerseys; down w/intermittent spasms, nystagmus

**Progressive ataxia of Charolais calves** (Mk 592; IM 1145; VC/N 189) • Rare, inherited?

**Spinal bifida** (Mk 586; IM 1149) • Rare; paresis & para- or tetraplegia

**Cerebellar malformations** (IM 1105) • Reported in 2 Ayrshire calves & in Jersey calves

**Arnold-Chiari Syndrome** (Mk 578; Br 699) • Cerebellum through foramen magnum

**Weaver Syndrome** (Mk 581, 592; BR-hb 639; BR 1640; IM 1144; VC/N 189; C&T 92; DC 428; N-L 262)

- Brown Swiss calves, rare, genetic, progressive degenerative myeloencephalopathy, begins at 6 mos.; Course: 12-18 mos. • Tx: Euthanasia

## Bovine familial convulsions & ataxia (IM 1105; BR-hb 641; BR 1644; N-L 234)

- Angus cattle, multiple tetanic clonic convulsions & a spastic ataxia that persists for several mos, gradually recover by 2 yrs old; fatten & slaughter, don't breed (possibly genetic)

## Neuraxial edema; Maple syrup diz (BR-hb 639; BR 1641; Br 149; 695; IM 1111; N-L 200)

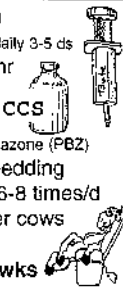

- Rare, polled Hereford calves, amino acid metabolism problems
- CS: Dulness, opisthotonus, recumbency, poor response to touch or auditory stimulus
- Dx: Elevated ketones in urine & burnt sugar smell to urine, vacuoles in neuraxis, esp. white matter

## Inherited congenital myoclonus (BR-hb 642; BR 1645; Br 149; IM 1112; N-L 200)

- Rare; Hereford & polled Hereford-cross calves; short gestation, hip joint lesions
- CS: BAR (bright & alert!), but recumbent, some unable to move heads, Extension & crossing of hind limbs, hypersensitivity to sound & touch, Myoclonic spasms & body rigidity on stimulation
- Tx: none; Euthanasia

**"Sweeney", Suprascapular paralysis** (IM 1169; Br 364; VC/N 193; L 339; DC 428; N-L 337)  
 \*\*

- Trauma to suprascapular n. where it crosses cran. border of scapula
- **CS: Acute - lat. slipping of shoulder; Chronic - atrophy, "Sweeney"** (prominent scapular spine)
- **Tx: Rest** • **Prognosis: Not severely incapacitated**

**Brachial plexus evulsion** (IM 1169; Br 365; VC/N 194; L 341; DC 430; N-L 341): ★ Excessive traction during calving • CS: variable on nerves involved • Tx: NSAIDs & support • Px: depends on severity

<b>Radial n.</b> IM 1169; VC/N 196; C3T 68; BR 1320; Br 365; L 338; S-U 68; N-L 339; DC 429 ***	<ul style="list-style-type: none"> <li>• <b>Radial nerve:</b> dives into triceps brachii m. - Passes in brachial groove to emerge on lat. side of limb under the dist. border of lat. head of triceps</li> <li>• <b>Innervates all extensor mm. of limb</b></li> <li>• Cause of paralysis                             <ul style="list-style-type: none"> <li>- Direct trauma</li> <li>- Lat. recumbency w/o padding on lat. side of limb (where it emerges under triceps)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>"High radial nerve paralysis"</b> (injury above entrance into the triceps m.)</li> <li>- <b>"Dropped elbow"</b></li> <li>- <b>Unable to bear weight on limb</b></li> <li>- Neurogenic atrophy of extensor mm. of limb</li> <li>- + CS of lower radial nerve injury</li> </ul>	<ul style="list-style-type: none"> <li>• <b>History, CS</b></li> </ul>	<ul style="list-style-type: none"> <li>• Tx: (see above) Time &amp; TLC to see if function returns</li> <li>• Animal can learn to "flip" dist. limb so foot lands correctly ("lower radial n. paralysis")</li> </ul> <p><b>Prognosis:</b></p> <ul style="list-style-type: none"> <li>• <b>Poor if dysfunction &gt; 2 wks</b></li> </ul> 
		<ul style="list-style-type: none"> <li>• <b>"Lower radial n. paralysis"</b> (injury near lat. elbow)</li> <li>- <b>Knuckling over</b> (fetlock joint)</li> </ul> 		

**Sciatic n. paralysis** (IM 1170; C3T 959; Br 366; VC/N 206; DC 431; N-L 341; L 346)  
 \*\*\*

- Most commonly in postpartum cows, part of "obturator n. paralysis" syndrome; Injection in gluteal mm. in neonates, pelvic txs, tumors, abscesses • CS: Limb hangs at rest, dropped stifle, knuckling, but can bear wt. (femoral n. intact) • Tx: see above

**Femoral n. paralysis** (IM 1169; VC/N 198; Br 366; L 342; DC 430; N-L 341): \*\*\* Overstretching (struggling downer cow, calf during dystocia) • CS: Can't bear wt. (extensors of stifle) • Tx: see above

### Peroneal n. paralysis

Mk 500; IM 1170; VC/N 208; C3T 322; Br 367; L 347; DC 433, N-L 344

- **Peroneal n.:** supf. as crosses lat. surface of gastrocnemius m.
- **Recumbent postpartum** dairy cows w/ hypocalcemia or other causes (lying on nerve)

\*\*\*

- **Knuckling at fetlock**, wear dors. surface
- **Hyperextension of hock**
- **Desensitization of cranial** limb from stifle to hoof
- **Trip**
- **Usually temporary**

- **Hindlimb lameness w/ fetlock flexed**

- **Tx: see above**
- **Time, usually recovers**

### Obturator n. paresis, Calving paralysis

Mk 495; IM 1172; C3T 322; Br 366; VC/N 202; L 344; DC 433, N-L 311, 342, 345 \*\*\*

- **Obturator nerve:** passes down shaft of ilium (pelvic inlet) through obturator foramen
- **Supplies adductors of hindlimb**
- **Dystocia** (calf damaging obturator & ischiatic nerves on way through canal)
- **Plays a role in "downer cow syndrome" in milk fever**
- **Coxofemoral luxation or femoral neck fxs sequelae**

- **Nonslip surfaces** - minimum deficit
- **Splay leggedness** (severe abduction)
  - "Splits" to sides on slippery surfaces (can't adduct limbs)
- **Hopping gait**
- **Recumbency w/ hind legs to each side**
- **No cutaneous sensation loss**

- **Just calved**
- **"Splits"**

- **Tx: see above**
- **Keep on firm ground, no slippery surfaces**
- **Hobbles around on dist. metatarsus**

### Spastic syndrome,

Periodic spasticity; Stretches, Barn Cramps, Crampy, Krampfigkeit  
Mk 503; IM 1147; VC/N 168; BR 463; Br 149, 388; L 353; N-L 216

- **Adult > 3 yr**, Holsteins & Guernseys
- **Genetic in nature**
- **Beef rarely affected**

**DDx:**

- Tetanus (recumbency) (p 145)
- Spastic paresis (calves)
- Laminitis
- Colic
- Peritonitis

- **Episodic spasms & stiffness** of both hindlimbs, progresses to rest of body
- **Standing animal**
- **No CS when recumbent**
- **Normal gait between episodes**
- **Lasts for mins, then relaxes, looks like stretching**
- **Episodes closer & closer together in time**

- **CS, History**
- **Age - Adult dairy cattle**
- **Progressive**

- **Provide ample exercise**, relieves spasms
- **No cure, just manage**

**Prognosis:**

- **Good if adequate exercise**

### Spastic paresis, Elso Heel

Mk 592, 502; C3T 92; VC/N 168; BR-hb 641; BR 463, 1644; Br 149, 387, 685, 700; DC 399; N-L 216

- **Calves 3 wks -12 mos**
- **More common than stretching**
- **M/b hereditary**, ("Els0" a bull w/ lots of affected offspring)
- **Holsteins & Angus** (all breeds affected)
- **Myotonia:** sustained contraction of muscles w/ stimulation

- **Taunt gastrocs & SDF** (supf. digital flexor)
  - **Hock & stifle in full extension**, calcaneus against tibia
  - **Initially 1** then both hindlimbs
- **At all times** when standing
- **Pendulum walk** (can't flex hock, so circumduct to keep limb from dragging)
- **Tail elevated** (when walking)
- **Progressive**

**DDx:**

- Spastic syndrome (adults) (p 137)
- Gonitis (inflam. of stifle)
- Dors. luxation of patella
- Progressive posterior paresis

- **CS**
- **Age < 12 mos**
- **Initially 1 limb affected**

- **Salvage**
- **Salvage procedure to gain weight, not for breeding (hereditary)**
  - **Sx - cut branches of tibial n. to gastroc:**
  - **Sx - tenotomy of gastroc. & partial tenotomy of SDF**

**Prognosis:**

- **Cut tibial n. - 54% success**
- **Tenotomy - 40%**

**DDx - Spastic syndrome from paresis**  
**Syndrome: Adults - Intermittent**  
**Paresis: Calves - Constant**

Condition/Facts	Presentation/CS	Causes
<p><b>Brain stem lesions</b> (IM 159; VC/N 182; BR-hb 204; BR 481)</p> <p><b>Brain stem:</b> midbrain, pons &amp; medulla</p> <ul style="list-style-type: none"> <li>• <b>RAS</b> (reticular activating system): concerned w/ conscious level</li> <li>• <b>Proprioceptive fibers</b> pass through</li> <li>• <b>Cranial nerves</b> assoc. w/ brainstem</li> <li>• <b>UMN, sensory &amp; proprioceptive fibers</b> pass through</li> <li>• <b>Walking motion reflexes</b> <ul style="list-style-type: none"> <li>- Generated in centers caud. to the midbrain</li> <li>- Initiated rostral to midbrain (higher centers)</li> <li>- Descending motor tracts from higher centers <u>cross over</u> in the midbrain</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>↓ Consciousness</b> (depression, stupor, coma)                     <ul style="list-style-type: none"> <li>- Profound depression (RAS)</li> </ul> </li> <li>• <b>Deficits in CN III - XII</b></li> <li>• <b>Vestibular system CS</b> (see below)</li> <li>• <b>Proprioceptive (Proprcpt) deficit &amp; gait</b> <ul style="list-style-type: none"> <li>- Proprcpt. defc. w/ norm. gait - midbrain or rostral</li> <li>- Proprcpt defc. w/ abnorm. gait - caud. to midbrain</li> </ul> </li> <li>• <b>UMN &amp; proprioceptive deficits all limbs</b></li> </ul> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>Proprioceptive deficit &amp; gait</b></p> <ul style="list-style-type: none"> <li>- Proprioceptive deficit w/ norm. gait - midbrain or rostral</li> <li>- Proprioceptive deficit w/ abnorm. gait - caud. to midbrain</li> <li>- Rostral lesions (cerebro-diencephalic) - contralateral (opposite) proprioceptive defc., normal gait</li> <li>- Caud. to the midbrain (brain stem &amp; spinal cord) - ipsilateral (same side) proprioceptive defc., abnormal gait</li> <li>- Midbrain lesions - normal gait &amp; proprioceptive deficit on both sides</li> </ul> </div>	<p><b>Causes</b></p> <ul style="list-style-type: none"> <li>• Listeriosis (pg 143)</li> <li>• Thromboembolic meningoencephalitis (TEME) (pg 141)</li> <li>• Otitis interna/vestibular diz (pg 142)</li> <li>• Brain abscess or tumor</li> <li>• Horner's syndrome (can be due to oculomotor n. damage)</li> <li>• Hypovitaminosis A (pg 142)</li> </ul> 

## Lesion - Vestibular System

- Control posture in relationship to gravity; & eye movements in relationship to head movements
- **Peripheral vestibular centers:** inner ear (labyrinth, receptors, & vestibular n., not proprioceptive fibers)
- **Central vestibular** (vestibular nuclei in brain stem & centers in cerebellum) motor, sensory & proprioceptive centers (brain stem) located in area

- **Head tilt**
- **Nystagmus**
- **Ataxia**
- **Possibly circling & falling towards lesion**
- **Strabismus**
- **Central vestibular diz** (brain stem) also shows:
  - **Nystagmus in any direction**
  - Postural deficits (proprioception) & paresis (UMN)
  - Depression (RAS in area of vestibular nuclei)
  - Recumbency, lesion side down
  - Lean against wall
  - Loss of perception of sensation
- **Peripheral vestibular diz** also show:
  - **Nystagmus - horizontal only**
  - No UMN signs (paresis)
  - Ataxia bec. of loss of balance, not due to proprioception
  - No decr. sensorium or depression

- Listeriosis (pg 143)
- TEME (*Haemophilus somnus*)
- Peripheral vestibular diz
- Brain abscess or brain tumor
- Otitis media/interna (pg 142)

## Cerebellar lesions

Mk 578; VC/N 181; BR-hb 639; BR 858

- **Coordinates movements**, but does not initiate them
- **Vestibular system connections** to help coordinate balance & posture
- Proprioceptive fibers don't pass through cerebellum
- **Menace response**, somehow cerebellum plays a role

- **Incoordination (ataxia)** (excessive range, rate & force of movement)
  - **Wide-based stance** from balance deficits, not proprioception
- Tremors
- Abnormal movements of the head
- **Vestibular diz signs**, including:
  - Head tilt
  - Nystagmus
- Loss of menace response, but not blind
- BAR, because RAS not affected
- **No proprioceptive deficits**

- Cerebellar hypoplasia
- BVD, Blue tongue, Akabane, Border diz
- Cerebellar abiotrophy (pg 143)
- Bovine familial convulsions & ataxia (pg 136)
- Grass staggers (Bermuda, Dallis, Rye grass, Kikyu, Canary)
- Hypomagnesemia (pg 146)
- Locoism (pg 147)

## Cerebral lesions

Mk 578; IM 1037; VC/N 179; BR-hb 199; BR 481

### Cerebral hemispheres & basal nuclei

- **Voluntary motor control, behavior, & mental status**
- **Interprets vision & audition, proprioception & general sensations**
- **Thalamus**: functionally, it is closely related to the cerebrum to which it relays information

- **Mild to marked depression** (less than brain stem lesion)
- **Alterations in behavior** (aggression, rage, hypersexuality)
- Seizures
- Propulsive circling (wide)
- Head pressing, continual chewing (odontoprisis)
- Normal gait in straight line w/ abnorm. postural reactions (proprioception loss, stumbling, knuckling over at fetlock)
- **Blindness** (occipital lobe) w/ normal pupillary responses

- Rabies (pg 144)
- Trauma/hematoma
- Lead poisoning (pg 152)
- Salt poisoning (pg 153)
- Vit A defc (pg 142)
- Plant poisoning, *Conium*, *Cicuta*, *Laburnum*, Milkweeds, *Anconitum*, *Aesculus*, *Astragalus*, *Solanum*, etc.
- Pseudorabies (pg 141)
- Malignant catarrhal fever
- Urea poisoning (pg 153)
- IBR (pg 154)
- Insecticide poisoning
- Dehorning/sinusitis

- Nervous coccidiosis (pg 150)
- Hypocalcemia
- Hepatoencephalopathy (pg 154)
- Hypoxia/anoxia
- Hypomagnesemia (pg 146)
- Hypoglycemia
- Hydrocephalus (pg 143)
- Idiopathic epilepsy (pg 154)
- Narcolepsy (pg 154)

## Hypothalamus

- **Controls the autonomic nervous system (ANS) & the endocrine system**

### Autonomic & endocrine abnormalities

- Polyuria/Polydipsia (PU/PD)
- Altered sleep patterns
- Rage to affectionate behavior
- Abnormal appetite

### Pituitary abscess (IM 1035)

- Sporadic ataxia, Death

## BVD -

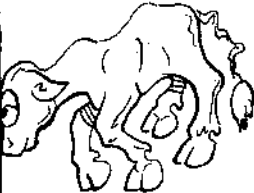

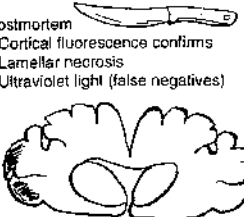

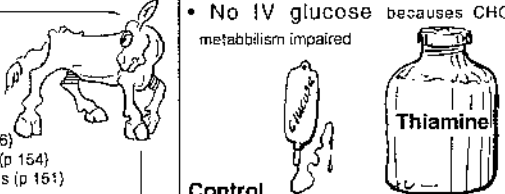

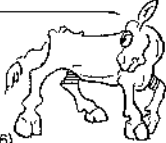

### Cerebellar hypoplasia

IM 1103; N-L 230

- **See Repro. pg 124**; Infection of pregnant cows at 100-170 days: congenital cerebellar hypoplasia; infection at 90-100 days: abortion or stillbirth
- **CS**: At birth - truncal ataxia, opisthotonus, wide-base stance, intentional head tremors, hypermetria, hyperreflexia, nystagmus or strabismus
- **Dx**: Hx, CS, BVD antibodies in precolostral blood
- **Tx**: None • **Px**: Grave - rarely improves

Bluetongue can also cause cerebellar hypoplasia

## Haemophilus septicemia, TEME, ITEME

Thromboembolic  
meningoencephalitis,  
Mk 602, CST 546; IM 1092; C3T  
662; BR 486, Br 811; VC/N 81; Pic  
144; N-L 87

\*\*\*

- **Haemophilus somnus**, Gram neg. pleomorphic rod or coccobacillus
- **Calves, Feedlot**, 4-12 mos  
- 4 wks after entering feedlot
- **Septicemic diz**
  - Tropism for brain (cerebellum & brain stem)
  - Lungs (pneumonia more common)
  - Joint infections
  - Infertility, metritis, vulvitis, orchitis, conjunctivitis, otitis, mastitis
- Morbidity low 2-10%

**Calves, 4 wks after entering feedlot**  
**CS: Resp. + CNS + Joint**  
**Dx: Calf (Resp. + CNS + Joint); CSF**  
**Tx: Hi ABs + Thiamine**

- **Respiratory CS:** alone or leading to CNS CS
  - Cough, dyspnea, pleuritis, fever
- **CNS - cerebellum & brain stem**
  - Depression
  - Ataxia, paralysis
  - Knuckling at fetlock, fall while walking, interference (proprioceptive deficits)
  - Blindness
  - Recumbency
  - Opisthotonic, nystagmus, strabismus, head tilt
  - Coma & death - 36 hrs m/b
- **Septic arthritis** hock & stifle
- **Retinal hemorrhages** (vasculitis) seen w/ all forms

- **Calves w/ CNS, resp., & joint disease**
- **Lab**
  - CSF analysis
    - . Neutrophilia (elev. PMNs)
    - . ↑ protein
    - . Xanthochromia
  - *H. somnus* org. hard to culture
- **Postmortem**
  - Vasculitis to septic infarcts & abscesses

### DDx:

- **Polioencephalomalacia** (p 140)
- **Hypovitaminosis A** (p 142)
- **Listeriosis** (p 143)
- **Malignant catarrhal fever** (but other system involvement)
- **Lead poisoning** (p 152)

**Polioencephalomalacia (PEM)** cannot be distinguished clinically from TEME so give thiamine along w/ ABs

- **Effective if early** (check other feedlot cattle every 2 hrs)
- **IV ABs at hi levels** (double dosages)
  - **Micotil®**

  - **Oxytetracycline**
  - **Penicillin/streptomycin**
- **Also thiamine** - In case m/b PEM, if cow has headache give thiamine
- **Chlortetracycline** in feed for 10 ds (for herd Tx)
- **Course of disease** 2-3 wks
  - 

**Prognosis:**  **Thiamine**  
• Good if early  
• **Mortality 90%** if not Treated early,  
- Once recumbent - grave

**Bacterin** - available, but only 80% seroconvert  
• Given at time of weaning, prior to shipping to feedlot (should be preconditioned to go to feedlot, but not cost effective. At most castrations & weaning on farms, then rest [vac., etc.] at feedlot)

## Pseudorabies, Aujeszky's diz, Mad Itch, Infec. Bulbar Paralysis

Mk 602, IM 1017; VC/N 49; C3T  
422; BR-hb 419; BR 1094; Br 705;  
DC 415; N-L B6, 361; Pic 147

\*\*

- **Herpes virus**
- 1<sup>st</sup> seen in swine (swine resistant to clinical diz, latency infec. on recovery)
  - Spreads to ruminants)
- **Fatal diz in cattle** - CNS
- **Hx: contact w/ swine**
- **IP:** 90 to 156 hrs (short)

- Initial excitement phase (m/b aggressive, agitated)
- **Mad itch, acute pruritus, self mutilation** (chewing & biting themselves)
- **Salivation**
- **Abnormal behavior** (depression or aggression)
- Weakness & ataxia, paralysis
- Convulsions & death 24-48 hrs after initial CS
- Found dead (short IP)

- **CS + Exposure to swine**
- **Brain submitted for rabies**

### DDx:

- Rabies (p 144)
- PEM (p 140)
- Salt poisoning (p 153)
- Meningitis (p 151)
- Lead poisoning (p 152)
- Hypomagnesemia (p 146)
- Enterotoxemia (p 149)

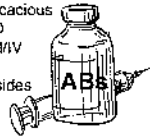

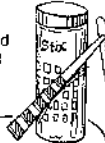

- **None**, once contacted virus
- **No vaccine**
- **Fatal**, occasional spontaneous recovery

**Control:**  
• Prevent contact w/ swine  
• Disinfect area (quaternary ammonium)

## Listeriosis, Circling Diz,

Listeriosis, Mk 356, 1609, IM 1088; C3T 580; Plc 142; BR-hb 278, BR 484, 660; Br 703; VO/N 75; DC 410; N-L 189

\*\*\*

### Brain stem meningoencephalitis (most common in ruminants)

#### • *Listeria monocytogenes*

- Gram positive rod
- Present in soil, silage & feces
- Assoc. w/ **silage feeding** (therefore in winter or spring, prior to new pasture growth)
- **Microabscesses** in brain
- #1 Bact. infec. of CNS in adults
- Herd outbreaks
- **Brain stem & cran. nerve "lateralizing" diz** - adults
- Ascending infec. cran. nerves
- **Septicemia** - neonates & steers
- More common in monogastric animals, seen in lambs & calves before rumen is functional
- < 3 wk of age
- **Abortions** (late gestation)

- **Depressed (RAS)**
- **Fever, anorexia**
- **Unilateral limb signs**
  - Knuckle over
  - Weakness to paralysis
- **Unilat. cranial nerve CS** (see box)
  - Lip droops, inability to blink
  - Head tilt, Nystagmus
  - **Circling, Ataxia**
  - ↓ Facial sensation
  - **Dysphagia** (difficult swallowing), m/b only sign (paralysis of facial & throat muscles)
  - Stertorous breathing
  - Paralysis of tongue ipsilateral
- **ABORTIONS** (late gestation)
  - Encephalitic form & abortions usually don't occur simultaneously
- **SEPTICEMIA**
  - Dysentery
  - Focal hepatic necrosis

**Silage - Outbreak - #1 bact. infec. of CNS, Unilateral CS: Brain stem (Circling, CrNs) - Septicemia - Abortions**  
**Dx: CS, CSF, PM (Abscesses)**  
**Tx: High dose tetracycline**

### Brain tumors

IM 1083; BR-hb 206; BR 491

\*

- Cause compression of brain stem; Cran. Nerves V, VII & VIII & cerebellum
- Tumors: medulloblastoma, ependymoblastoma, neurofibrosarcoma, meningioma, meningeal hemangioma, angioblastoma, neurofibroma
- **CS & Dx:** Hypermetric gait, ataxia, Depression, Facial paresis/paralysis, Facial anesthesia/analgesia, Head tilt, strabismus & nystagmus
- Tx: None

### Cerebellar abiotrophy

\*\*

- (IM 1068, 1104; C3T 93; BR-hb 639; BR 1636; Br 148; N-L 232) • **Degeneration of formed cerebellar tissue due to premature aging, 3-9 mo-old Holstein heifers (NE U Can); also in Hereford, Ayrshire & Jerseys; Hereditary (recessive gene)** • **CS:** Normal at birth, Cerebellar CS at 3-9 mo. progresses rapidly for several days then stabilizes, m/ remain static or slowly progress to recumbency
- **DDx:** Cerebellar hypoplasia (present at birth) • **Tx:** Euthanasia

### Hydrocephalus

\*

- (CT 530; C3T 92; BR-hb 201; BR 201, 147, 483)
- Dome-shaped cranium, Neurologic deficits

143

- Isolation & ID org. (difficult brain, fetal tissue)
- Herd outbreak of brain stem diz w/ unilat. signs of circling
- **Unilat. involvement of multiple cran. nn.** highly suggestive
- CSF fluid - i # of mono-cytes (thus name) 
- **Postmortem:**
  - **Microabscesses** in brain

### Cranial Nerves:

- **Facial n.** paralysis
  - Lip droop, inability to blink
  - 2° keratoconjunctivitis
- **Vestibulocochlear n. (CN 8)**
  - Head tilt
  - Nystagmus
  - Circling
  - Ataxia
- **Trigeminal (CN 5)**
  - Decr. facial sensation
  - Poor jaw tone
- **Cranial nerves 9 & 10**
  - Dysphagia (trouble swallowing)
  - Stertorous breathing
- **Hypoglossal (CN XII)**
  - Paralysis of tongue, ipsilateral

- **Early**
- **Tetracyclines** (high doses, but m/b followed by fatal relapse, therapeutic levels in brain difficult)
- **Penicillin - high dose** 
- **Isolate** (long time, 1 mc)
- **Take off silage** on trial basis
- **IV fluids, TLC**
- **NO vaccine in USA**

### Prognosis:

- **Early Tx - Good**
- **Recumbent, coma - Grave**

### Control:

- **No spoiled silage**

### DDx

- Brain stem abscesses (p 140)
- Inner ear infections (p 142)
- Rabies (p 144)
- Bacterial meningitis (p 151)
- TME (p 141)
- Polioencephalomalacia (p 140)
- Lead poisoning (p 152)

PH

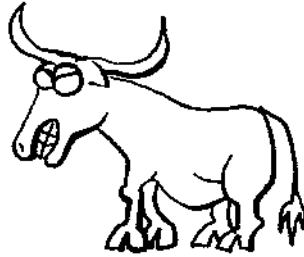

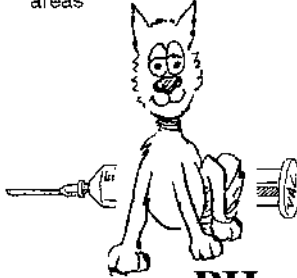

### Public Health

- **Humans/listeriosis** from milk or secretions • **CS:** septicemia, meningitis & abortions

# Botulism & Rabies

# NERVOUS SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Rabies</b></p> <p>Mk 619; IM 1024; C3T 414; BR-hb 417; BR 1087; Br 706; DC 413; GI 708; L 119; N-L 62, 361; VC/N 45; Pic 146</p> <p><b>**</b></p>  	<ul style="list-style-type: none"> <li>• <b>Rhabdovirus</b> (Lyssavirus)             <ul style="list-style-type: none"> <li>- Worldwide, except some free islands (Eng.)</li> <li>- <b>Fatal neurological diz of warm blooded animals</b></li> <li>- Reservoirs (bats, dogs, foxes, skunks &amp; raccoons)</li> </ul> </li> <li>• <b>Pathophysiology</b> <ul style="list-style-type: none"> <li>- Transm: bites (virus in saliva)</li> <li>- Reaches CNS over peripheral nn.</li> <li>- From CNS to salivary glands over nerves</li> <li>- IP 3 wks - 3 mo (different length nerves)</li> </ul> </li> <li>• <b>Progressive &amp; rapidly fatal diz</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Behavioral changes</b> (1st)</li> <li>• <b>Tenesmus</b> (constant sign)</li> <li>• <b>M/ or m/n "salivate"</b></li> <li>• <b>Progressive lameness, ataxia &amp; posterior paresis</b></li> <li>• <b>Furious form ("mad dog" form)</b> <ul style="list-style-type: none"> <li>- Alert, not normal placid expression</li> <li>- Muscle tremors</li> <li>- Bloat</li> <li>- <b>Tenesmus</b></li> <li>- <b>Aggression, bellowing</b>, belligerent, attack &amp; pursue (as diz progresses, less belligerent)</li> <li>- Run frantically through fences, etc.</li> <li>- Hypersexuality, mounting objects, paraphimosis</li> <li>- Tactile/auditory stim. behavioral changes</li> <li>- <b>Pruritic</b></li> <li>- Proprioceptive deficits</li> <li>- Recumbent, convulse, Die w/in 2-4 ds</li> </ul> </li> <li>• <b>Dumb form</b> <ul style="list-style-type: none"> <li>- <b>Severely depressed</b></li> <li>- <b>Profuse salivation, dysphagia</b> (inability to swallow due to pharyngeal paralysis)</li> <li>- Anorexia, temp &gt; 103° F, drooped head</li> <li>- <b>Flaccid paralysis</b>, wide base stance, difficulty rising</li> <li>- <b>Die - laryngeal paralysis</b></li> </ul> </li> <li>• <b>Paralytic form</b> (common in cattle)             <ul style="list-style-type: none"> <li>- <b>Flaccid tetraparesis or paraparesis</b></li> </ul> </li> <li>• <b>Forms can overlap</b></li> </ul>    	<ul style="list-style-type: none"> <li>• <b>Notify authorities</b> <ul style="list-style-type: none"> <li>- PM done by state officials</li> </ul> </li> <li>• <b>FA staining tech.</b> (Ag/ Ab) (fast)</li> <li>• <b>Intracerebral inoculation - mice</b>, examine brain in 5 ds</li> <li>• Negri bodies - microscopic brain sections (hippocampus) (historic method)</li> </ul> <p><b>DDx:</b></p> <ul style="list-style-type: none"> <li>• <b>Abnormal behavior</b></li> <li>• Digestive disorders</li> <li>• Injury</li> <li>• FB in mouth</li> <li>• Lead poisoning (p 152)</li> <li>• Early infec. diz</li> <li>• <b>Inability to swallow</b></li> <li>• Choke (p 15)</li> <li>• FB lodged between teeth</li> <li>• Ingestion of irritating subst.</li> <li>• Obstruction (p 44)</li> <li>• <b>CNS</b></li> <li>• Focal spinal cord diz (p 133)</li> <li>• <b>Lameness</b></li> <li>• Musculoskeletal prblms.</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Isolate/Euthanize &amp; notify authorities</b></li> <li>• Valuable animal isolate for at least 6 mo</li> </ul>  <p><b>Control:</b></p> <ul style="list-style-type: none"> <li>• Mass vaccination of dogs &amp; cats</li> <li>• Approved vaccines for cattle</li> <li>- Recommend annual vaccinations in endemic areas</li> </ul>  <p><b>PH</b></p> <p><b>Public Health</b></p> <p>Human immunization strongly recommended for veterinarians</p>

**DDx for all abnormal behavior**

**Furious, Dumb & Paralytic forms - All fatal**

**CS: Behavior changes, Tenesmus**

**Dx: Notify authorities - they post**

**Tx: Euthanize - 6 mo isolation**

## Botulism, Forage poisoning

Mk 328, IM 1159; C3T 568; BR-hb 285; BR 680; Br 554; DC 439; GI 708; L 121; N-L 315; VC/N 93; Pic 205

\*

- Rare
- **Lethal food poisoning** of man & animal
- *Clostridium botulinum* (type B, C & D)
- **Toxin: ? blocks Acetylcholine** at NMJ (neuromuscular junction), motor peripheral nn. affected, not sensory or CNS
- Gram pos., anaerobic, spore forming
- Ubiquitous in soil
- **Assoc. w/ Silage feeding**
- Wound contamination, Carcasses w/ harbor
- Poultry litter
- **Individ. sporadic cases > herd outbreaks**

## Progressive muscular paralysis

- Mimics rabies
- **Muscle weakness & ataxia** (hindlimbs 1st then cranially) w/ persist for wks if mortal
- Disturbed vision
- **Salivation & dysphagia** (paralysis of tongue)
- Droopy expression, protruded tongue, ptosis (ANS)
- GI: rumen atony, bloat, constipation & mucus-covered feces
- Urinary: distended atonic bladder
- **Death - 24 hrs or persists for wks**

- **Difficult to confirm Dx**, improbable to demonstrate toxin in tissue or feed
- **Inject mice** w/ serum, gut content or organs from affected animal => resp. distress & death
- **Presumptive Dx:**
- Motor paralysis
- Suspected
- Eliminate other causes
- Hx of silage feeding

- **Symptomatic**
- Fluid, nutrition, nursing
- Controversy over value of purgatives
- Antitoxin of little value even in early stages

- Prognosis:**
- **Grave:** Acute & peracute will die

## Control:

- Proper disposal of carcasses
- No decaying grass or spoiled silage in diet
- **Vaccine (toxoid) only in enzootic areas**

## ACh at NMJ - Silage - Individual

**CS: Rapidly fatal motor paralysis (mimics Rabies)**

**Dx: Difficult, Mice inoculation**

**Tx: Supportive if alive • Px: Grave**

## DDx:

- Rabies (p 144)
- 2nd-stage milk fever (responds to Ca Tx) (p 148)
- Listeriosis (p 143)
- Bovine spongiform encephalopathy (no paralysis)(p 154)

## Tetanus, Lockjaw

Mk 330; IM 1150; C3T 567; BR-hb 284; BR 877; Br 567; DC 436; L 120; N-L 202; VC/N 89; Pic 205

\*\*

- *Clostridium tetani*
- Toxin producing, Spore in soil/feces
- World wide distribution
- All species susceptible (#1 horse & man)
- Gen. individ. cattle, not herd outbreak
- IP 10-14 d (wk - wks)
- Transm.: Contamination of uterus (dairy), tail docking, castrations, dehorning, bull rings, infec. umbilical stalks, deep puncture wounds
- **Toxin** ascends nerves to spinal cord, causing ascending paralysis, if excess toxin in blood to brain, descending tetanus, toxins: tetanospasmin, tetanolysin & nonspasmodogenic
- **Reduce inhibition to motor nerves, causing hypertonia & spasms**

**Toxin - Decr. inhib. on motor nerves**

**CS: Muscular rigidity => "Sawhorse"**

**Tx: Penicillin, Muscle relaxants, Quiet**

**Px: Good if standing; Long recovery**

- **Initially muscle spasms**
- Masseter, neck, hindlimb
- General stiffness
- **Tonic spasms & hyperesthesia**
- **Sound & tactile stimuli** (incr. # & severity)
- **Muscular rigidity**
- "Lockjaw" (masseter)
- Prolapse of 3rd eyelid (horses >> cattle)
- **Erect ears**
- Retracted eyelids
- "Pump handle" tail
- "Sawhorse" stance (extensor rigidity)

## DDx

- Polioencephalomalacia (p 140)
- Enterotoxemia (p 149)
- Lead toxicity (p 152)
- Salt poisoning (p 153)
- Bact. & viral encephalitis (p 151)

- **Usu. presumptive Dx:** History & CS
- **No reliable clinical test** for Dx (CSF tap, culturing not too helpful)

- Bloat common & m/b presenting CS
- Excess salivation
- Regurgitation of feed & water
- Convulsion - recumbency
- Fatal usually if convulsions

145

1. Remove source
2. **High levels of penicillin** (lavage uterus w/ penicillin). Give systemically, plus debride & inject wound site
3. **Antitoxin** if early (prevents toxin binding to nerves, once bound, can't unbind)
4. **Muscle relaxation**
- Acetylpromazine + 5% pentobarbital (cheap), or Diazepam (\$)
5. **Support**
- Quiet, dark stall, pack ears w/ cotton
- **Good footing, deep bedding, m/b sling**
- **Good nutrition, rumenotomy**

**Px: Good, if can make stand, better than horses; if survive 7 ds - fair to good. Long recovery, 3-4 wks**

**Prevention: No immunity on recovery**

- Generally don't vaccinate (because more resistant than horses & small ruminants)

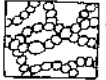

# Poisonous Plants

146

# NERVOUS SYSTEM

### IBR Encephalitic diz,

"Rednose"  
MK 730, CST 417,  
837; IM 1009, 639;  
BR-hb 409; BR  
1061; Br 256; DC  
90; 197; GI 777; R-  
M 250; Derm 106;  
N-L 361  
\*\*\*

- See Gen 252
- Acute fatal encephalitic form
  - Calves < 6 months old
  - Occasionally infected
- Adults: common upper respiratory tract/bronchopneumonia diz, also enteric form, IPB, & abortion storms
- Herpesvirus 1 (BHV 1)

- CNS signs - 100% mortality
  - Incoordination (proprioception)
  - Alternating excitement, depression
  - Blindness
  - Head pressing, aimless circling, head tilt, nystagmus
  - Salivation
  - Bellowing
  - Convulsions, coma, death
- Mild nasal & ocular discharge

- History, CS
- Antibody titer only good indication of exposure
- Serum Neutralization Test - TOC
- Necropsy
  - Lesion in cerebral cortex, internal capsule
  - Immunoperoxidase test (monoclonal antibodies)
  - Virus isolation

- No adequate treatment
- Keep warm
- If convulsions: diazepam or phenobarbital

Prevention:  
• Vaccination just before weaning may prevent all clinical forms of IBR

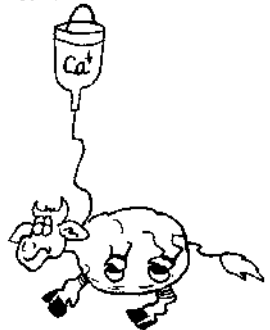

Prognosis:  
**Grave** near 100% die in 5 days (occasional recovery)

Auscultate heart &amp; peripheral pulses (facial a.) for change in HR or cardiac arrhythmias leading to cardiac arrest</li> </ul> </li> <li>- <b>SQ or IP</b> (less cardiac failure) (asepsis &amp; 50 ml per site so no local reactions)</li> </ul> </li> <li>• <b>Retreat in 8-12 hrs</b> (those that relapse or fail to get up)</li> <li>• <b>Ketosis</b> (250-500 ml of 50% dextrose IV)</li> <li>• <b>IV phosphorus</b> in field if doesn't respond to Ca Tx &amp; no blood analysis</li> <li>• <b>Commercial preparations</b> containing Ca, Mg &amp; K can be tried</li> <li>• <b>Inflate udder,</b> if no response to anything else</li> </ul> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>Prevention:</b> appropriate feeding during dry period, ability to mobilize Ca in response to PTH &amp; incr. absorption of Ca from GI, requiring PTH &amp; Vit D</p> <ul style="list-style-type: none"> <li>• <b>Lower Ca intake</b> during dry period (i.e., 80-100 mg Ca/d., 2-3 x this in lactating)           <ul style="list-style-type: none"> <li>- Excessive amounts of Ca during dry period causes a decr. in synthesis of PTH, which takes time to change</li> </ul> </li> <li>• <b>Feed just hay</b> during dry period (want Ca/P ratio of 2.3 to 1, but better to check amount of Ca. Some alfalfa 2% Ca. Need 0.4% Ca for dry cows)</li> <li>• <b>Massive doses of Vit D</b> (20-30 million units daily) in feed 5-7 d before parturition will reduce incidence (incr. Ca from GI tract), but if parturition more than 4 ds later, cow more susceptible (toxicity also a concern)</li> <li>• <b>Single IV injection of crystalline Vit D</b> 8 ds before calving effective, if doesn't calf give another injection</li> <li>• <b>High doses of Ca</b> 1 d before, at, &amp; 1 d after calving</li> <li>• <b>High Cl<sup>-</sup> &amp; Sulfa</b> diets, ammonium chloride &amp; ammonium sulfate in basal diet, working w/ nutritionists</li> </ul> </div>

High prod. dairy, After birth, ↓ Ca  
 CS: Wobbly - Downer - Lat. recumbency  
 Dx: Hx, CS  
 Tx: IV Ca gluconate, Retreat in 8-12 hrs  
 Prevention: Lower Ca during dry period

**Characteristic responses to Ca therapy:**

- Tremors over flank, then spread to entire body
- Improved cardiac function, stronger heart sounds, pulse rate decr.
- Eructation & defecation, muzzle starts to sweat
- Animal rises gen. w/in an hour, then urinates. 60% usually stand 1-2 hrs into therapy
- If not within 8-12 hrs, must re-eval.; may need P or Mg or more Ca, or may have toxemia

**Down long time & little response or relapse**

- Maintain in sternal recumbency - allows eructation
- Water & electrolytes
- Roll from side to side if doesn't immediately rise, or sling if available. Get off heavy muscles
- Check udder for mastitis either prior to parturition or due to recumbency
- Complications in 15-25%, w/ relapses see in 8-10 hrs. M/b displaced abomasum (usually recurrent), aspiration pneumonia, mastitis, metritis w/ open cervix postparturient, musculo-skeletal damage, nerve damage, uterine prolapse (not often), but with uterine inertia & low Ca

**Rumen alkalosis:** Soy bean or high protein engorgement, Fermentation reduced & saliva continues • CS: Muscle tremors, Convulsions, Slow, shallow breathing, then dyspnea • Tx: Ringer's

**Enterotoxemia**

\*\*\*

- See Gen pg 250 ; *Clostridium perfringens* types B&C, Well fed calves up to 1 mo
- CS: Acute diarrhea, Dysentery, Abd. pain, **Convulsions, Opisthotonus**, Death m/b in few hrs, Recovery over couple of ds possible
- Dx: PM - Hemorrhagic enteritis & ulcerations of mucosa, Gram stain for gram +, rod-shaped bact., Toxin detection of filtrates
- Tx: **Usually ineffective**, Hyperimmune serum, Antibiotics PO, Outbreak in newborns: antiserum immediately after birth
- Prevention: Vaccination of pregnant dam in last 3rd of pregnancy, initially 2 doses 1 mo apart then annually

**Fatty liver/**

Pregnancy toxemia

\*\*\*

- See GI pg 32; Sporadic diz in fat, pregnant cows, Fat (dairy), Pregnancy toxemia (beef)
- CS: Fat pregnant cows, anorectic, restlessness & incoordination, sternal recumbency, rapid resp. & grunting, 7-10 ds comatose & death
- Dx: Ketonemia, ketonuria, hypoglycemia & proteinuria, Elev. liver enzymes, PM: Enlarged, fatty liver
- Tx: Generally ineffective, esp. if recumbent, steroids, glucose, fluids, propylene glycol, induce parturition, supplement herd
- Px: Grave

**Nervous ketosis**

DC 419  
 \*\*\*

- See GI pg 32; Metabolic diz of lactating cows, days to few wks postcalving, reduced CHO's - metabolizes fat = ketoses
- CS: Weight loss, circling, staggering, head pressing, blind, acetone breath, self limiting; subclinical: no CS
- Dx: Hypoglycemia, ketonemia & ketonuria (Ketostix®), Response to Tx
- Tx: Glucose IV, Glucocorticoids IV, Propylene glycol PO
- Px: Rarely die, return to milk production important
- Prevention: Hi plane of nutrition before calving, incr. after parturition

**Babesiosis,**

Tick fever  
 \*

- See Cardio. pg 91, Tick borne erythrocytic diz, tick eradicated in USA - protozoan, Babesia (many types), *B. bigemina* & *B. bovis*
- CS: Fever, Hemolytic anemia, "Red water", icterus, **cerebral hypoxia**: hyperexcitable & convulse, opisthotonus, coma & die. Abortion and death
- Successful eradication of tick in USA

# Horner's Syndrome

# NERVOUS SYSTEM

Condition	Facts/Cause	Clinical Signs	Diagnosis	Treatment

### Sympathetic pathway

- Descend from brainstem down neck to synapse in T1-T3 segments of spinal cord
- Preganglionic fibers pass over T1-T3 spinal nerves to sympathetic trunk in dors. thorax
- Pass through stellate (cervicothoracic) & middle cervical ganglia to pass up neck in vagosympathetic trunk to synapse in the cranial cervical ganglion
- Postganglionic fibers pass to sweat glands of head, dilator muscles of the iris, periorbital smooth muscles & periarteriolar musculature

### Sympathetic disruption to head

CS: Miosis, Enophthalmos, Ptosis, Sweating

### Malignant catarrhal fever: See GI pg 10; "Sheep ascc" viral dz of GI & resp. systems. CNS CS occasionally from disseminated necrotizing vasculitis of CNS

- \* (trembling, incoordination, stupor, depression, terminal nystagmus, belligerence & bellowing, fever, hemorrhagic diarrhea • Dx: Hx (Sheep), CS, Microscope (vasculitis)  
 • Tx: Unsuccessful • Px: > 95% die in 2-18 ds

### Nervous coccidiosis

IM 1041; BR-hb 454; BR 181; Br 701; CV/N 104

\*\*\*

- See Gen pg. 260
- Coccidial protozoan
- *Eimeria bovis*, *E. zuernii*
- Mechanism unclear
- 2 yr, winter

#### Eimeria

CS: CNS - Blindness, Ataxia, Seizures

Tx: None effective

- **Depression, somnolence**
- **Blindness**
- **Ataxia/conscious proprioceptive deficits**
- **Odontoprisis (teeth grinding)**
- **Hyperexcitability**
- Propulsive walking
- Head pressing
- Intermittent seizures, progressing

- History, CS, Postmortem

- **Therapeutic Tx ineffective**
- Try 1 treatment of Sulfa bolus, amprolium, thiamine, ABs, fluids & leave calf alone

Prognosis: Grave Control

- Monensin (100 mg/kg 30 d) prophylactic feeding

Monensin

## Meningitis

Mk 808; IM 1030; BR-hb  
207; BR 493; Br 215; DC  
407; N-L 88

★★★

- **Emergency: Early recognition & Tx**
- **Large dose - Broad spec. ABs 10-14 ds**, Culture & sensitivity
  - Naxel®, Penicillin, 3rd gen Cephalosporins, Trimethoprim-sulfonamide (TMS) combo
  - NOT chloramphenicol or tetracyclines
- Plasma/blood transfusion (IgG)
- Supportive therapy
  - Fluids
  - Sedation (Valium®, 0.01-0.4 mg/kg IV; phenobarbital, 20 mg/kg IV)
  - Long term control of convulsions
    - .. Valium®, phenobarbital
  - Analgesics (Banamine® & PBZ)

Prognosis: Guarded

Sporadic bovine encephalomyelitis,

Buss diz, Transmissible serositis,

Meningoencephalitis  
Mk 624, IM 1029; BR-hb  
422; BR 1105; Br 706; N-  
L 87; VC/N 58

★

- **Rare**, endemic on some farms
- Chlamydia (psittacosis); also a form caused by a paramyxovirus
- Cattle & buffalo only
- Transmission: unknown
- Pathophysiology
  - Vasculitis

Rare, Chlamydia

CS: Resp, GI, CNS

Dx: Elementary bodies, Culture

Tx: Tetracyclines

- Multisystem diz
- Fever, anorexia, depression, stiffness
- **Resp:** nasal discharge, dyspnea, cough
  - Grunt - Pleuritis - pain like hardware diz
- **Lameness:** painful hooves, polyarthritis
- **GI** (initial diarrhea)
- **CNS** (encephalitis)
  - Ataxia, conscious proprioceptive deficits
  - Circling, head tilt, opisthotonus, hyperesthesia, stiff neck
  - Convulsions & coma
- Die in 4-10 d

151

- Elementary bodies in pleural & peritoneal effusions highly suggestive
- Culture chlamydia - blood & body fluids injected into a guinea pig IP

- Tetracyclines effective early

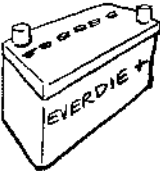

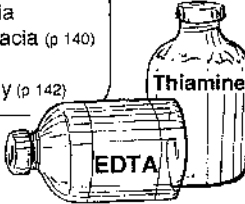

Tetracyclines

Prognosis: Death rate 31%

## Miscellaneous

## NERVOUS SYSTEM

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<p><b>Lead toxicity</b></p> <p>Mk 1674, IM 1071; BR-hb 558; BR 1469; BR 617, 704; VC/N 137; N-L 97; Pic 216</p> <p>***</p> 	<ul style="list-style-type: none"> <li>• <b>Cattle &gt;&gt; horses</b></li> <li>• <b>#1 inorganic poisonings</b></li> <li>• Cattle indiscriminate eaters, more likely to lick or chew lead objects &amp; drink used motor oil</li> <li>• Ingestion &gt;&gt;&gt; through skin</li> <li>• <b>Old batteries #1</b> <ul style="list-style-type: none"> <li>- Vegetation &amp; soil contaminated from fallout from smelters &amp; mining</li> <li>- Leaded gases, Crankcase oil</li> <li>- Painted fences</li> </ul> </li> <li>• <b>Cumulative over time</b></li> <li>• Pathophysiology           <ul style="list-style-type: none"> <li>- Pb deposited in bone, "sink organ"</li> <li>- Interferes w/ -SH enzymes (sulfhydryl) involved in heme synthesis</li> <li>- Shortens RBCs life &amp; basophilic stippling</li> <li>- Rapidly enters brain = Acute cerebellar hemorrhage &amp; edema (capillary dysfunction)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Encephalopathy - GI</b> <ul style="list-style-type: none"> <li>- Acute</li> <li>- Bellow</li> <li>- Stagger (proprioceptive)</li> <li>- <b>Blind, head pressing</b></li> <li>- <b>Maniacal excitement</b> (crash into objects)</li> <li>- <b>Death w/in 2 hrs</b> or</li> <li>- Convulsions (intermittent)</li> <li>- Depression, ataxia, circling &amp; grinding teeth</li> <li>- <b>"Snapping of eyelids"</b></li> </ul> </li> <li>• <b>GI</b> <ul style="list-style-type: none"> <li>- Constipation</li> <li>- Colic</li> <li>- Diarrhea older cattle</li> <li>- Bloat (crankcase oil)</li> </ul> </li> <li>• "Lead line" on teeth rarely seen</li> </ul>  	<ul style="list-style-type: none"> <li>• CS</li> <li>• <b>Conc. whole blood (&gt; 0.3 ppm) diagnostic</b></li> <li>• <b>Admin. ## Chlorinated hydrocarbons (HCH)

\*\*  
\* 

- See Tox pg 207; Use curtailed bec. of persistence in environment (DDT [prototype]), Lindane approved for use around livestock, Sources: contaminated feed or water, Recommended levels no problem, Diffuse stimulant of CNS
- CS: Stimulation or depression of CNS, Depression alternates fasciculation, Convulsive seizures (unlike OPs)   **DDT**  
- Dx: Hx, CS, Lab (levels in blood, serum or urine), PM (Absence of lesions, ppm of CHC in liver & brain tissue)
- Tx: No antidote, Symptomatic: Dermal - wash; Oral: oil, activated charcoal, CNS: Barbiturate, Valium® IV fluids or gastric tube

## Water deprivation, Salt poisoning, Sodium toxicity

\*\*

- See Tox pg 205: **Water deprivation**/ "Salt poisoning", Swine & poultry, Occasionally in ruminants (if low water consumption)
- GI tract (vomiting, diarrhea, abd. pain, anorexia, mucous in feces); CNS (blindness, seizures, partial paralysis, knuckling) **Die w/in 24 hrs of CS**
- Dx: CS, Hx of limited water intake, Na conc. in plasma & CSF >160 mEq/L, Necropsy
- Tx: **IV fluids**, induce diuresis & correct gradually, too fast = cerebellar edema, Lasix®
- Px: Grave - most die

## Urea toxicity

NPN, \*\*\*

- See Tox pg 204
- Urea not poisonous
- Ammonium (NH<sub>3</sub>) is toxic
- Sources: NPN feed additive
- Need to adapt over days to weeks
- Mechanism: Inhibits TCA cycle: incr. in lactate (acidosis)

- **Rapidly progressive** 20-60 min
- **Muscle tremors initially**
- "Bovine bonkers" 
- Rumen atony => **bloat** 
- Terminal convulsions to death

- CS, History, dietary exposure
- Smell ammonia m/b

- Often impossible - speed of CS

- Fluid therapy, Relieve bloat
- Ruminal infusion (vinegar), feed water (40 L)
- Rumenotomy add hay slurry 

### Prevention:

- NPN < 1/3 of total nitrogen in ration
- Slowly adapt to NPN feed

Prognosis: highly fatal

Excess NPN converted to ammonium  
CS: Acute, "Bonkers", Convulsions, Death  
Dx: Hx, CS, Ammonia smell, Lab, PM  
Tx: Difficult (rapid), Relieve bloat, Fluids

## Narcolepsy/cataplexy

\*

IM 1088; BR-hb 194; N-L 136

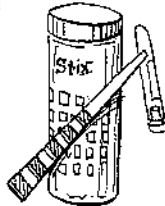

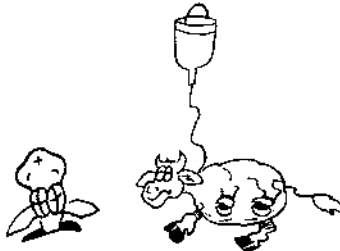

- Rare, reported in a Brahman bull; sleep episodes at inappropriate times, Stimulation (restraint, feeding, change in environment) causes animal to fall down & appear comatose; animal appears normal between episodes
- Tx: Imipramine (0.5 mg/kg) a tricyclic antidepressant or amphetamine sulfate m/ prevent narcoleptic attacks

## Epilepsy

\*

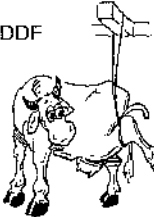

IM 1084; BR-hb 209, BR 497; N-L 95

- Extremely rare, described in Herefords & Brown Swiss • Cause: genetic? So rare no specific Tx regime
- Tx not indicated: incurable

# Subsolar abscess, Puncture of sole

## Pododermatitis traumatica

IM 1317; C37 864; BF 868; VC/L 35; S-O 196; Pic 90; DC 370; L 182

\*\*\*

- #1 Lameness of cattle (90%)
- Causes: damage to sole
  - FB (foreign body) penetration
    - . M/not be infected if it doesn't reach corium
    - . Abscess forms in sensitive corium if infected
- Laminitis
- White line separation
- Cracks
- #1 Lat. claw (hind foot), med. claw (front foot)

- 3 legged lameness often
  - Reluctance to bear wt on toe
    - Base-wide or base-narrow stance
  - Drainage above coronary band in time
- 
- Sequelae
    - Osteomyelitis of coffin joint
    - Tenosynovitis

- Hoof testers (repeat 3-4 times)
  - Pare out sole
    - Follow black lines or visualized punctures
  - Rads - not indicated & often unrewarding in cattle, in horses used to see if joint or bone involvement & taken prior to FB removal
- 
- 

### DDx

- Fractures
- Stifle injury (p 166)

90% of lameness; FB/Laminitis/Cracks  
**CS: Lameness**  
**Dx: Pare out sole, Hoof testers, Rads**  
**Tx: Drainage, NSAIDs, Wooden block**

### Predisposing factors:

- Filthy environment
- Corkscrew claw (pg 160)
- Inadequate foot care
- Puncture wounds
- Trauma

### IVRA (intravenous regional anesthesia, Bier block)

- Tourniquet below tarsus or hock
- Inject anesthetic into superficial veins

### Toe

- Front of sole/dors. region (toe, anterior)

- Lameness rapid & severe
- 3-legged lame
- Heat, swelling, localized pain

### Heel

- Plant/palm. (heel, posterior)
- No frog (unlike horse) & thick heels so navicular bursae rarely affected
- M/ travel up sensitive laminae & separate hoof from laminae
- New heel growth over laminae

- Lameness - slower & less severe
- Heat, swelling, localized pain
- M/ drain above coronet of heel

### White line diz

- Type of subsolar abscess
- Junction betw. hoof & sole
  - Common site of infec., more so than horses
  - Infection tracts under sole, up laminae & out at coronet
- Hind limbs - plantar lateral side
- Front limbs - dorsomedial toe

- Lameness
- Pus m/b released at coronary band (like "gravel" in horses)

- Remove foreign body (M/ cure lameness if it hasn't penetrated the corium)

### #1 Adequate drainage

- Pare out dark tract, remove all undermined sole
    - . Leave any new sole deep to abscess
    - . Release pus & possible gas
    - . Don't block drainage hole
  - Trim wall to 1/3" (1 cm) below reforming sole (longer wall - manure & mud accumulation)
- 

### Bandage or not?

- Clean & dress w/ antibiotic (powder)
    - . Plastic bag taped over claw (to keep clean)
  - No, if soaked w/ urine or manure
  - . Leave open + drying agent (Koppertox®)
  - . Clean & drying agent BID or EOD
  - . Simple sole abscesses heal nicely w/o bandaging
- 

- NSAIDs - "Bute" (for pain) (10 mg/kg/d)

- Wood block on unaffected claw to keep wt. off affected one (attach by epoxy [Technovit®] & allow to wear off in a couple of weeks)

### White line diz

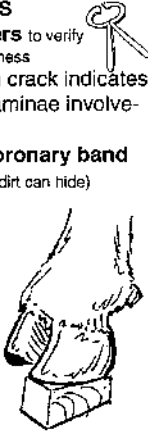

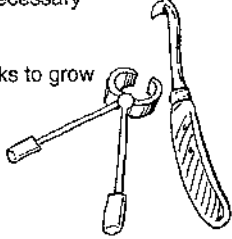

- Drain (remove hoof right above abscess to allow drainage out wall instead of at ground surface)
- If draining from coronet, expose entire tract (or septic navicular bursitis m/ occur)

- Heel abscess as above; if separation of hoof from laminae; remove old hoof in stages
- 

### Prognosis:

- Good - dramatic relief in 24 hrs, recover in 7-10 ds
- If no improvement reevaluate

**Foot rot,  
Interdigital  
necrobacillosis,  
Interdigital  
phlegmon,  
"Foul-in-the-foot"**

Mk 501, C3T 869; IM 1173;  
Br 356; BR-hb 342, 227;  
BR 509, 867; Pic 96; L  
151; DC 380

\*\*\*

- **Common**
- **Inflam. of interdigital SQ tissue**
- **Hindlimbs most common**
- **#1 lameness in young stocker & fattening units**
- **Dairy - young heifers**
- **Cause - infectious**
  - ***Fusobacterium necrophorum***, *Bacteroides nodosus* & *B. melaninogenicus*, fungus
  - *Fusobacterium* ubiquitous in environment
  - **Trauma - skin broken, bact. invade**
  - **Wet environment, or**
  - **Dry, hard ground causing abrasions**
  - **Local Immunity? Digit s/dom affected twice**
  - **Predisposing: short heels & long toes**

- **Lameness** (sudden onset, moderate to severe)
    - **Fetlock & pastern held flexed w/ little w. on toe**
  - **Deep tissue: Interdigital space swollen & painful (m/ spread claws), palmar > dors.**
  - **Interdigital space fissure & necrosis**
  - **Foul odor, but little pus**
  - **↑ Temperature**
  - **↓ Milk production**
  - **Weight loss**
- Complications**
- **Septic arthritis**
  - **Tenosynovitis**

- **History, CS, foul odor**
- **Biopsy - culture**

**DDx**

- **FB (p 157)**
- **Stable foot rot (p 159)**
- **Interdigital hyperplasia (coms) (p 160)**
- **Other causes of lameness**
  - **Sole ulcers (p 166)**
  - **Sole abscesses (p 157)**

- Prevention**
- **Reduce trauma** (move off stibble & stones)
    - **Attempt to keep feet dry**
  - **Foot baths, 5% formalin, 10% copper sulfate or 10% zinc sulfate weekly**
  - **Chlorotetracycline feeding (feedlots), Oral iodides (EDDI, ethylenediamine dihydroiodide) in feed**

**Deep/SQ, Common, *F. necrophorum*, Stockers**  
**CS: Lameness, Smelly, Rotten interdigital fissure, Swelling**  
**Dx: Hx, CS, Odor**  
**Tx: ABs, Debridement**  
**Prevention: Foot baths, Feed additives**

**Stable foot  
rot, "Scald"**

**Interdigital dermatitis,  
Chronic necrotic  
pododermatitis,  
"Slurry heel"**

Mk 501; IM 1416; BR 510;  
Br 357; C3T 868; Pic 100;  
L 158

\*\*\*

- **Supf. inflam. of interdigital skin**
- ***Bacteroides nodosus* agent?**
  - **Not part of natural farm flora, can be eradicated**
  - ***F. necrophorum* increases severity**
- **60% of herd m/ be affected**
- **Hind feet**
- **Predisposing**
  - **Wet stable, standing in slurry**

- **Interdigital eczema, esp. betw. bulbs**
  - **Secretions oozing from dorsal commissures of cleft, then dry crust**
  - **No lameness, but sensitive to touch**
  - **Little swelling**
- **2° Erosion of heels, undermines heel horn**
  - **Lame** (sensitive gait, cowhocked stance, oversized lat. claw)
  - **2° sole ulcer - lat. claw**

- **History, CS**
- **Lab confirmation difficult**

**Supf., *B. nodosus*, Wet environment**  
**CS: Interdigital eczema, Heel erosions (lameness)**  
**Dx: Hx, CS**  
**Tx: Eczema (pasture, formalin), Erosions (pare, block)**

- **Mild cases**
  - **Usually rapid healing, 2-4 days**
  - **ABs: Penicillin, sulfonamides, tetracyclines** (shortens course of diz)
- **If necrotic areas present:**
  - **Clean & debride**
  - **Remove necrotic interdigital mass**
  - **Koppertox®, Copper sulfate (5%)**
  - **AB bandages**
  - **Wire claws together**
  - **Clean environment**
- **Suppurative arthritis or tenosynovitis**
  - **Surgical removal of claw**
  - **But if > 80% of digit removed culled w/ in 1 yr**
  - **Surgical drainage & arthrodesis of coffin joint in valuable animals**

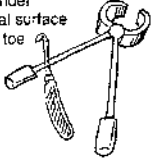

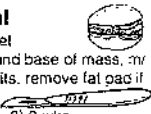

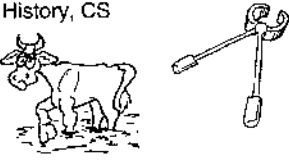

- Prognosis:**
- **Good** - once necrotic tissue is removed or sloughs, heals rapidly usually
  - **Poor** - if arthritis or tenosynovitis

- **Superficial infections**
  - **Turn out to pasture** (usually spontaneously resolve)
  - **Footbaths BID - 5% copper sulfate or 3% formaldehyde**
  - **ABs for severe infections**
- **2° heel erosions**
  - **Paring of claw to shift weight to medial claw**
  - **Affix block to medial claw**

- Prevention:**
- **Formalin foot bath (3%) for 1 wk**

		<b>Above bulbs, Long toe CS: Wartlike Tx: Trim, Sx</b>		

## Septic pedal arthritis

Mk 467; IM 1295; S-O 202; S-T 289; S-N 249; Pic 93; DC 373; L 197

\*\*\*

- Common, Deep sepsis
- Very serious condition
- In coffin joint, navicular bursa or synovial sheaths
- Cause - extension from:
  - Interdigital lesions (joint supf. in dors. cleft)
  - Septic sand cracks (located slightly abaxial to insertion of extensor tendon, joint supf. here also)
  - Abscesses of white line into coffin joint or navicular bursa
  - Sole ulceration

### Factors - amputation

- Value of animal
- Size (2000 lb. hard time on 1 digit)
- Usually < 1200-1400 lb. dairy cows

**Coffin joint, Navicular bursa, Synovial sheaths**  
**Extension of interdig. ditzs, Sole abscess/Ulceration**  
**CS/Dx: Very painful, Swollen coronet**  
**Tx: Amputate claw (< 1200 lbs)**

- Very lame, very painful
- Coronet swollen, inflamed & painful
- Interdigital granulation tissue, pus drainage
- Stop lactation

### History, CS

- Rads can help
- Offset each digit (oblique)
- Osteomyelitis in P2-3 & sepsis in P1-2

### DDx

- Foot rot (bilat. swelling)(p 159)
- Stable foot rot (p 159)

- 1• Amputate digit as it's very painful, unless of great value or very large animal
- 2• Streetnail procedure (deep drainage procedure)
  - Resection of DDF
  - Opening coffin joint
  - Flush apparatus to dors. side
  - Bloat trocar - or tubes

### Prognosis:

- Guarded

### Amputation of digit (L 229)

- Cutting skin flap & doing proper closure causes less healing time
- Dors. incision in middle of claw, not middle of leg
- Lift skin flap from hoof (circumferentially)
- Amputate through dist. end of P1
  - Cannot go higher than 1/3 of P1 (artery, nerves to other digit)
  - Angle cut so skin flap can be sutured axially
  - Gigli wire: start wire in straight, then turn to angle cut, cutting through flexor tendons & ligate digital vessels
- IVRA best anesthetic
- Tight bandage, if see bleeding, put more on & wrap tighter
- If cannot remove all infected tissue, don't close completely
- Drainage

## Gangrene, Fescue foot gangrene, Ergot gangrene

Mk 497; IM 1312; CST 870; Pic 124, Tox 394

\*\*

- See Gen pg 264
- Dry gangrene of lower legs & feet
- Rear limbs especially
- Consuming tall fescue (*Festuca arundinacea*), toxin in stems & leaves
- Ergot infested feeds (Claviceps)
- Cold temperatures contribute
- High levels of nitrogen in soil
- CS w/in 10-14 ds of grazing

### Initially hindlimb lameness

- Local heat, swelling, severe pain
- Cold pasterns, red coronary band
- Line of demarcation between hock & claw - fetlock or pastern
- Skin below dry, gangrenous & eventually sloughs
- Tail & ears also
- Unable to walk or stand

### History, CS

- Tall fescue in pasture
- Claviceps-infested feed

### DDx:

- Early: Foot injury, foot rot (p 159), laminitis (p163)
- Late: "Alkali diz" (selenium toxicosis) (p 226)
  - Frostbite (p 163)
  - Foot rot (p 159)
  - Trauma

### Tall fescue, Ergot

**CS: Sloughing of skin of distal limbs**

**Tx: Remove source, ABs; Nothing for gangrene**

- Remove from pasture
- Antibiotics, slow recovery
- Once necrosis: Slaughter

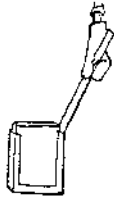

### Prevention:

- Mix legumes & growing low toxic strains of tall fescue (mowing doesn't help!)

# Laminitis

# MUSCULOSKELETON

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Fractures of P3</b> Mk 498; C3T 879; C2T 898; IM 1334; Br 362; DC 390; S-O 301; Pic 104; L 215, 229 <b>**</b> 	<ul style="list-style-type: none"> <li>• Common</li> <li>• Trauma: Medial front claw usually</li> <li>• Articular &amp; transverse usually</li> <li>• DDF distracts fragments</li> <li>• <b>Often bilateral</b></li> <li>• Cause poorly understood</li> <li>- Trauma</li> <li>- Nutritional - fluorosis</li> <li>- Foreign body penetration, osteomyelitis</li> </ul>	<ul style="list-style-type: none"> <li>• <b>3-legged lameness</b>, lay down a lot, reluctant to get up</li> <li>• <b>Cross legged</b> (to keep weight off med. claw)</li> <li>• <b>Incr. digital pulse</b></li> <li>• Heat in foot</li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Hoof testers</b></li> <li>• <b>Rads - definitive Dx &amp; location</b></li> <li>- Special angles to see process fxs (m/ be hard to see due to little displacement)</li> <li>- Retake in a couple of wks bec. lines more pronounced w/ remodeling</li> </ul> 	<ul style="list-style-type: none"> <li>• <b>Wooden block on unaffected claw</b> (keep wt. off affected claw)</li> <li>• <b>Penetrating FB fxs:</b> Surgical removal of loose or necrotic fragments</li> <li>• <b>Claw amputation last resort</b>, no use if bilateral</li> </ul>

**Laminitis, Founder, Pododermatitis aseptica diffusa, Aseptic pododermatitis**

Mk 500; IM 1300; BR-hb 823; BR 1617, 510; Br 380; C3T 867; C2T 896; DC 376; L 219; S-O 189, 215; Pic 104

\*\*\*

- Not as dramatic as in horses
- No rotation
- Subclinical usually
- Hindlimbs more commonly involved (opposite of horse)
- Dairy heifers/cows (hi-conc diet) or steers on hi-CHO diets
- Causes
  - #1 Endotoxins (vasoactive)
  - Cell walls of gram neg. bacteria
  - Killed by lactic acidosis
- Pathophysiology in laminae
  - Uncoupling of laminae betw. hoof & P3 (breaks down) due to ischemia, degeneration, Inflamm., pain & necrosis from:
    - . Vasoconstriction leading to arteriovenous shunting (from laminae to deep structures of foot)
    - . Coagulopathy leading to thrombosis
- Most get better
- Founder (annular) rings - horizontal lines on hoof wall reflect old bouts of laminitis
- Causes (see box)

**Endotoxins, Fat postpartum heifer**  
**CS: Subclinical, Lameness, "Slipper foot"**  
**Dx: Hx, CS, Hoof testers**  
**Tx: Treat cause, Banamine®**

**Frostbite**

Mk 498, 627; IM 1438; BR-hb 556; BR 1465; BM&S 495; Derm 88

\*\*

- Calves born in cold (windchill factor  $-18^{\circ}\text{C}$  ( $< 0^{\circ}\text{F}$ ))
- Feet & other extremities, ears, tail, teats, scrotum & dist. limbs
- Damaged tissue more susceptible to cold in future

**CS: Devitalized/Sloughed ears, Hooves**  
**Tx: Usually too late**

- Less marked than horse
- Anorexia, depression
- Reluctance to move
- Diarrhea
- Posture: all legs under body or fore- & hindlimbs extended forward, arched back
  - Leg crossing or narrow walking indicates medial claw only affected
- Recumbent
- "Slipper foot" (chronic)
  - Long hooves, turned up at toe
  - Heavy ridging on wall
  - Sole softens & turns yellow

**Subclinical**

- No abnormal gait or posture
- Soft horn, bloodstained & yellow, waxy appearance

**Sequelae**

- White line diz
- Sole ulcers
  - Sole has more blood w/ laminitis, so bleeds easy when paring (arteriovenous shunts)

- Reluctance to move
- Recumbency
- Devitalized ear tips, crusty muzzle, cold hindfeet
- Days-wks later sloughing of tissue, including hooves

- Arterial blood pressure depressed (opposite of horse)
- Hoof testers, pain over entire sole, esp. over toe
- CHRONIC:
  - Hoof growth & rings in hoof wall
- Herd
  - High incidence of midlactation lameness, white line diz & sole ulcers

**Causes:**

- #1 Fat heifers right after calving (fed high conc. & kept on concrete surfaces)
- Grain founder: overload of grain (wheat, corn, barley >> oats), Incr. lactic acid bact., low pH lyses gram neg. bact. (release of endotoxin)
- Sustained hi-CHO fed over long time (subacute or subclinical)
- Colonic torsion (breakdown of mucosa allows endotoxins into portal circulation)
- Retained placenta: postparturient laminitis (always serious)
- Pleuropneumonia
- Septic metritis
- Endotoxemia (always serious)

- Emergency - acute
- Tx cause
  - Grain overload - mineral oil
  - Rumenotomy if early
  - Septicemia - ABs
- Get moving to incr. circulation in feet
  - Medical Tx controversial (Steroids, antihistamines, antiprostaglandins [NSAIDs])
  - Banamine® (analgesic & decreases endotoxins)
- Chronic - repeated trimming

**Prevention:**

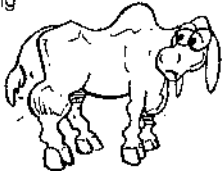

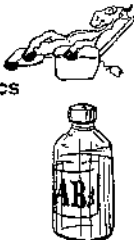

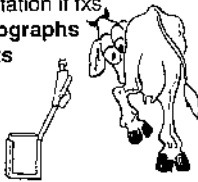

- Slow feed changes
- Trim entire herd 2 x/yr

- History, Cs

- Usually too late
- Emergency: thaw rapidly in warm water (100-111°F)
  - Analgesics (thawing painful)
  - Do not massage during thawing
  - Avoid premature debridement
  - Damaged areas left exposed (not bandaged)
  - Supportive care (high protein, high calories, vitamin supplementation)
  - Restrain to prevent self mutilation
- No treatment once CS

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Tarsal hydrarthrosis,</b> <b>"Bog Spavin"</b> VC/L 169; L 289, 174, 181, 182 **	<ul style="list-style-type: none"> <li>Chronic distention of tibiotarsal (TT) &amp; prox. intertarsal (PIT) joints</li> <li>Common in "postlegged" cattle</li> <li>Also cattle confined in stanchion w/ concrete floors w/ no exercise</li> </ul>	<ul style="list-style-type: none"> <li><b>Fluid distention TT &amp; PIT joints</b></li> <li>Little or no lameness</li> <li>- M/ tread w/ hind limbs &amp; lie down more</li> </ul> 	<ul style="list-style-type: none"> <li>History, CS</li> <li>Radiographs</li> <li>- No findings</li> </ul>	<ul style="list-style-type: none"> <li><b>Salvage (get another bull)</b></li> <li>Aspirate fluids</li> <li>Inject corticosteroids - relief for wks-mos</li> <li>- Dorsomedial pouch of TT joint</li> </ul>  <p>Prevention</p> <ul style="list-style-type: none"> <li>Exercise &amp; plywood on stanchion floor</li> </ul>

## Tarsal cellulitis/hygroma

Mk 811; LAS 193; Pic 117; DC 398; Br 389; BM&S B71; L 370; S-O 174

★★

- Common in cattle
- Lat. side of tarsus
- **Chronic irritation & trauma** (inadequate bedding in housed cattle on concrete)
- **False bursa** (sac of fluid on tarsus) m/b
- **Worry about 2° infec. & invasion of joint**

- **Bulge on lat. side**, usually hard unless bursa or abscess develops
  - Sac of fluid, synovial-like, clear & yellow, some viscosity
- **Abrasion m/b w/ abscessation**
- Cellulitis above & below hock
- **No lameness unless invades joint**
  - Swelling if into tibiotarsal joint
  - No swelling if in dist. tarsal joints

- History, CS
- Radiograph to see if invaded joint

- **Tx often frustrating**
- Acutely - stop trauma (bedding)
- **Cosmetic**, reducing size is difficult
  - Drain abscesses & remove necrotic tissue
  - Bursa: drain, steroids & bandage
  - ABs, NSAIDs, local stimulants & hydrotherapy used, but response is slow
- **If septic arthritis, must treat, poor Px**
  - Dist. tarsal joints have better Px than proximal

**Chronic trauma - Cellulitis, Abscess, Bursa - 2° joint infec.?**  
**CS: Lat. swelling, No lameness**  
**Tx: Frustrating, Cosmetic**

**Prevention (important)**  
 - More bedding, etc.; drain bursa early

## Tibial fx

Mk 498; IM 1331; C3T 879; Br 373; VC/L 125, 151; DC 400; BM&S 883; S-N 261

★★

- **Cows - try to fix** (horses - shoot)
  - Thick skin so doesn't compound medially
  - Cattle will lie down & look after themselves (horses don't)
- **Midshaft oblique or spiral** most common
  - Also prox. & dist. epiphyseal fx
- **Invariably override**
- **Traumatic cause**

- 3-legged lameness
- **Swelling & tenderness**

- History, CS
- Radiographs

**Thomas Schroeder splint:** ring w/ bars to foot plate, ring fits around & bars down leg, then using bandage material, attach to bars. If not perfectly stable, you get prolonged healing.

- **1. Salvage**
- **2. Confine & time**
- **3. Thomas Schroeder splints**
  - Not perfectly stable, long time to heal
- **Calves** - also Thomas Schroeder splints
- 2 compression plates in calves under 200 lbs
- Plates not sensible in adults
- Px too high to cast normally

**Midshaft, Override**  
**CS/Dx: 3-legged, Rads**  
**Tx: Thomas-Schroeder splint**

**Prognosis**  
 • **Poor**, withhold Px in calves until Tx attempted in simple, uncomplicated fx  
 • **Poor:** complicated or compound fx

## Femoral fractures

Mk 498; IM 1331; C3T 879; CV/L 151, 158; Br 373; DC 400; Pic 108; BM&S 881; S-N 261

★★★

- **Distal physes in neonates**
  - Dystocia or trauma
- **Capital (slipped) physis (SH-type I)**
- **Adults are salvaged**, Rare, "Mac truck" trauma
- Younger the better
- Wt. & comminution important Px factors

- 3-legged lameness
- **Shortened limb**
- **Hock held higher than other**
- **Downer cow**
- **Dimpling of musculature over fracture**
- M/b swelling

- **History, CS**
- **Palpation** - excessive movement of distal limb
  - **Crepitation** m/b (auscultation)
  - Patella loose, med. to lat.
- **Slipped capital physis in young, difficult to Dx**
- **Radiograph - definitive Dx**
  - Unfortunately many portable (handheld) units can't penetrate adults

- **Salvage for adults**
- **Confine & time**
- **Calves salvage, confinement or Sx**
  - Physeal & shaft Fxs
    - Stacked intramedullary pins (pin migration)
    - 2 bone plates in very young. Suction drains
  - Calves - slipped capital physis
    - Knowles pins in nondisplaced head
    - Femoral head osteotomy

**Calves: Physeal fractures**  
**CS/Dx: 3-legged, Short limb**  
**Tx: Adults-Salvage; Calves-Internal fixation**

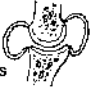

**DDx**  
 • Slipped capital physis from coxofemoral luxation

**Px depends on age, weight, location**  
 • **Poor - salvage adults**  
 • **Guarded - physis Fxs**

## Coxitis,

### Hip dysplasia

Pic 113, VC/L 154; Br 382; BM&S 680; L 294 \*\*\*

- #2 hindlimb lameness after stifle
- Usually DJD, rarely infectious
- Adults usually, calves - hip dysplasia
- Bilateral commonly

- Insidious, Muscle wasting
- **Stifle out, hocks in**
- "Rolling gait", lateral hind-quarter movement
- **Dragging hooves**
- If infectious - acute CS

- CS, History
- Crepitation (palpation or rectal)

**Hip dysplasia** (Br 382; VC/L 157): Flare & sporadic, Male calves < 2 yrs old, rapid weight gains, Heritable

- Tx: none
- Salvage

Prognosis: Poor

**#2 hindlimb lameness, Adults, Bilateral CS: "Rolling gait", Drag hooves • Tx: None**

## Coxofemoral luxation

Br 375; VC/L 198; CST 876; S-O 324; Pic 108; BM&S 881; L 269

\*\*

- **Common in cattle**, shallow acetabulum & no accessory ligament as in the horse
- **2-5 yr-old cows associated w/ parturition** (maximum ligament relaxation)
- **Slippery floors**
- **Obturator nerve paralysis**
- Milk fever, Dystocia
- Breeding accidents
- Position of femur
- **Craniodorsal** most common (80%)
- Caudoventral into obturator foramen (assoc. w/ obturator nerve paralysis)

- **Lameness:** Leg rotated laterally w/ toe-out, hock-in, stifle-out
- Craniodorsal - shorter limb
- **Recumbent**, unable to rise, lie extended & abducted slightly
- **Sequela: Downer cow**

- **Palpate:** altered distance betw. greater trochanters, tuber ischia, tuber coxae
- Trochanters asymmetrical
- **Manipulate leg** - crepitation
- Rectal palpation
- Radiographs (calves)

- **Closed reduction** tried 1st
  - Deep Rhompun® sedation (0.22 mg/kg IV)
  - Must get femoral head over rim of acetabulum & into socket
  - First find out which way its luxated
    - Craniodorsal luxation: pull caudoventrally & rotate to put back in
    - Calving jack for traction, attaching pastern & jacking leg down
  - Confirm replacement by sound & feel
- **Open reduction** (if closed reduction doesn't work & valuable animal)
  - Craniolateral approach to coxofemoral joint
    - Advantages, can clean out acetabulum (blood clot or muscle)
    - Steinman pin in head used as lever, costs more, risk of infection

### DDx

- Femoral neck fx
- Slipped capital physis
- Acetabular fx
- Fxs - gr. trochanter

**Craniodorsal 80%, Parturition CS: Acute lameness, Recumbent Dx: Asymmetry, Rectal**

**Tx: Reduction, Hobbles • Px: Guarded**

## Pelvic fractures

Mk 498; VC/L 153; Pic 112; Br 374; DC 400; S-O 332; S-N 260

\*\*

- **Rare, except tuber coxae**
- "Knocked down hip", **tuber coxae fracture** classic injury in cattle
- **Hitting "hook"** on door frame
- Other fractures: Wing & shaft of ilium, tuber coxae, symphysis pubis, obturator foramen, acetabulum & ischium
- Trauma in all cases - "Splits" (acetabular fx)

- "Dropped hip" - tuber coxae
- Little lameness or problems
- M/b sequestra & fistulous tract
- Other fractures:
  - Downer cow
  - Iliac shaft fx - very lame
  - Symphyseal or obturator foramen fx
  - **Lame in both limbs**
  - Complications
    - Severance of iliac arteries
    - Coxitis (DJD of hip - acetabular fx)
    - Reduction of pelvic diameter in cows

### History, CS

- Manipulation of limb & crepitation & pain, except tuber coxae fractures
- **Rectal palpation**
  - Move cow w/ hands in rectum
  - Feel crepitation
  - Grasp tuber coxae & move w/ hand in rectum
- Radiographs - but needs to be in recumbency & m/ make worse during recovery phase

### Tuber coxae fractures

- Leave, resolving in 2-3 weeks
- Sx: remove fragments if draining
- Other pelvic fractures
  - **No surgical method developed**
  - Box stall confinement 3 mo. (up to a year)
  - Cull

### Prognosis

- **Good for tuber coxae**
- **Poor - other fx**

### "Knocked down hip"

**CS: Little problem unless sequestrum • Px - Good Other hip fx: Downer cow; Poor Px**

## Thoracic Limb

## MUSCULOSKELETON

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Gastrocnemius rupture</b> BM&S 865; BR 1320; CST 880; Br 380; DC 388; L 390; S-O 238; Pic 118 <b>**</b>	<ul style="list-style-type: none"> <li>• <b>Uncommon</b></li> <li>• Unilateral &gt;&gt; bilateral, usually complete</li> <li>• Attempting to stand from postpartum paralysis</li> </ul>	<ul style="list-style-type: none"> <li>• "Hamstring"</li> <li>• Swelling</li> <li>• Inability to fix hock or stifle</li> <li>• Knuckling of fetlock</li> <li>• Complete rupture - hock on ground</li> </ul>	<ul style="list-style-type: none"> <li>• History, CS</li> </ul> 	<ul style="list-style-type: none"> <li>• Confine in well bedded stall</li> <li>• Thomas splint in extension</li> <li>• Prognosis: Complete rupture - Grave</li> </ul>

Sx removal time consuming &amp; bloody. Astringent (copper sulfate/iodine) destruction not advised (severe local reaction)</li> </ul>			

## Radial fractures

Mk 498; VC/L 115, 125; IM 1331; BM&S 881; DC 400; S-N 261; S-O 309

★★

- **Uncommon**
- **High energy injuries** (Mack truck)
- Transverse, oblique (most common), comminuted, open or closed
- **Open fxs uncommon** (med. surface)
- **Proximal fx worst, esp. if articular**
- **Adult cattle better Px than horses bec. will lay down**

- **Nonweight bearing lameness**
- **Swelling**
- **Instability, crepitation**
- **Open on medial side (rare)**

- **Easy to Dx**
- **Radiographs for type**

- **Salvage or stall rest**
- Young, if mid shaft fx, can probably fx
- **Full-limb casts w/ Thomas splints**
- NO full-limb casts alone
- **Bone plating** in young
- Distal fractures full limb cast alone m/o

- **Prognosis: Guarded to poor**

## Cast & Thomas splint

## Olecranon fractures (Ulnar) \*

Mk 498; S-O 312; IM 1331; BM&S 881; DC 400

- Olecranon serves as lever arm for triceps, not a weight bearing bone
- **Direct trauma** (kicked)
- Distracted or nondistracted
- Articular or nonarticular
- **Salter type I of growth plate**

- **Like radial nerve paralysis**
- "Dropped elbow", leg dragging, swings from shoulder
- Unable to extend elbow
- Variable heat, pain & swelling

- **History, CS, Manipulation**
- Radiographs - extent of fx

### Prognosis w/ Sx

- Good - nondisplaced, nonarticular fx
- Guarded - nondisplaced, articular fx
- Guarded - internal fixation
- Guarded to poor - physeal fxs

DDx  
• Radial n. paralysis

Like radial n. paralysis - "Dropped elbow"  
Tx: Rest - Bone plating

## Humeral fractures

Mk 498; Br 373; IM 1331; BM&S 891; JDC 400; S-N 261)

★★

- **Uncommon**
- **"Mack truck" trauma** (bone thick, short & covered by muscles)
- Middle third, dist. segment displaced caudally
- **Rare to compound**
- **RADIAL N. DAMAGE** main concern (travels in brachial groove), Trauma to severance

- **Swollen shortened arm**
- **3 legged lameness**
- **"Dropped elbow"**
- **Instability**

- **CS**
- **Radiographs definitive Dx**
- **Crepitation** (difficult bec. of muscles, stethoscope)

- **Calves < 6 mo**
- **Stall confinement 6 wk**

- Bandage forearm to thoracic wall
- Dropped elbow m/ remain, but can support weight
- Intermedullary pinning
- ASIF nailing & bone plating
- Pin migration races healing
- Plating

- **Adult - salvage**

- Confine in sling 6-8 wk
- PVC pipe splint to prevent flexural contracture

### Radial n. damage?

**CS: Swollen, Shortening, 3 legged, Dropped elbow**

**Tx: Calf-confine, pin or plate; Adult-sling**

**Px: Reserve until fx heals**

### Prognosis

- **Reserve until fx heals bec. of complications**
- Radial n. paralysis
- Failure of plates & migration of pins
- Unfavorable - adults

## Scapular fxs

Mk 498; IM 1335; L 323

\*

- **Rare, Most - simple, Spine, Supraglenoid tubercle, Neck, Glenoid cavity; Trauma**
- **CS: Lameness - mild to nonweight bearing, Shortening of cran. stride**
- **Dx: Direct palpation, Close observation of swelling, Crepitation, Rads definitive Dx**
- **Tx: Bone sequestra - surgical removal, Stall rest in sling; nonarticular fxs (bony union in several mo.)**
- **Px: Good - nonarticular; Poor - dist. neck fxs, glenoid fossa fxs**

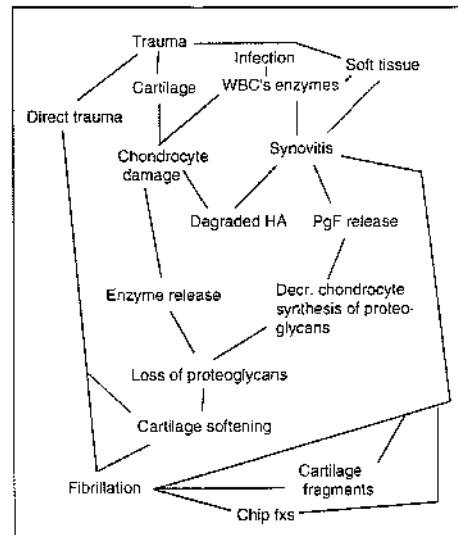

## Joint Injuries & Joint Diz (BR 522, 1441; Br 381, 383)

### • Group of disorders characterized by cartilage degeneration

- Cartilage has a limited potential for healing
  - . Superficial defects of cartilage do not heal
  - . Full thickness defects heal by granulation tissue to a weaker cartilage type

### • Causes

- Trauma: single incidence or repeated ("wear & tear")
- **Capsulitis & synovitis:** Type 1 synovial membrane damage or Type 2 (fxs, or direct trauma to cartilage)
- Direct cartilage damage (fxs); OC osteochondrosis; Joint instability/luxation; Age; Infections
- All of above cause **synovitis** (inflam. joint capsule)
  - Starts a vicious cycle of cartilage damage
  - Chronic process leads to chip fxs & cartilage fragments which further leads to more synovitis
  - Progresses to **DJD** (degenerative joint diz)/osteoarthritis/osteoarthrosis

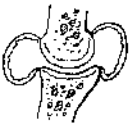

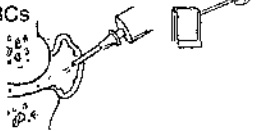

### Pathophysiology: Trauma/infection - self-perpetuating vicious cycle leading to DJD

- Complex & not fully understood
- Lack of correlation betw. pathological changes & clinical significance
- Direct trauma results in cartilage, chondrocyte & bone damage & causes **synovitis**
- Infectious arthritis: WBC's protease & collagenases cause destruction of cartilage & **synovitis**
- **Synovitis:** inflammation resulting in release of damaging products
  - Lysosomal enzymes & prostaglandins: degrade proteoglycans in articular cartilage
  - Prostaglandin synthases (local): degrade proteoglycans & suppress synthesis of proteoglycans & glycosaminoglycans by chondrocytes
  - Synthesis of interleukins: initiates destruction of chondrocytes
  - WBCs release destructive enzymes & O<sub>2</sub> free radicals: degrade hyaluronic acid & proteoglycans
- **Effects of damaging products**
  - Loss of proteoglycans that hold water & hydrate cartilage
    - . Decr. elasticity & resistance to compression
  - Decr. hyaluronic acid which bind proteoglycans & lubricates joint
  - Incr. enzymes that break down cartilage matrix
- **Results in softened cartilage which is more prone to damage** (vicious cycle leading to DJD)

### Proteoglycans (mucopolysaccharides)

- Linear hyaluronic acid (HA) molecule
- Glycosaminoglycans (GAG) side chains (numerous)
  - . Repeating units of disaccharides
  - . Polyionic nature (negative charge propels each other to form tense meshwork holding large amounts of water)
  - . Provides cartilage w/ resistance to compression
- Glycoprotein attach glycosaminoglycans to HA

**Neonatal septic arthritis/ Osteomyelitis, Polyarticular septic arthritis, "Joint ill", "Navel ill",**

**Septic arthritis, infectious arthritis**  
Mk 417, 469; CST 101, 821, 873; BR-hb 48, 226; BR 140, 527; Br 213; S-J 111(f)

- **Bact. infec. in a calf's joints**
  - Mycoplasma & chlamydial infec. also
  - **Usually systemic infec. also**
- < 2 wks
- Multiple joints usu. (carpus, tarsus, stifle)
- **Cause**
  - **Hematogenous** (almost always)
    - . Umbilical infection (navel ill)
      - .. Classical origin
      - . Following any systemic bact. infect./septicemia
      - . Salm., E. coli, Strap. spp, Staph. spp, Actinomyces pyogenes, Erysipelothrix,
- **Predisposition**
  - **FPT** (failure of passive transfer)
  - Poor hygiene during calving
- **Pathophys.** - Cartilage damage
  - Bacteria, inflam., fibrin
  - Release of enzymes, hi WBCs & bacteria cause cartilage damage
  - Loss of GAGs (cartilage protectants)

**Systemic, Hematogenous, Navel ill, FPT**  
**CS: Sick, Lameness, Swelling**  
**Dx: Hx, CS, Synovial fluid, Zinc sulfate**  
**Tx: Systemic ABs, Lavage, Bandages**  
**Px: Poor**

- **± Systemically ill:**
  - Depression, Inappetence, Fever, Elev. heart rate
- **Variable lameness**
  - . Mild initially, progressing rapidly to nonwt. bearing
  - Reluctance to move
- **Joint effusion**
  - 1 or more joints, thickening of dors. joint capsule, hock, stifle, carpus
- **Polyarticular** common (hock, stifle, carpus)
- **Heat**
- **Fever**
- **Complications:**
  - **Osteomyelitis**
  - Recurrence
  - DJD

**DDx**  
• Intra-articular fxs  
• Physeal fxs

- **Similar to adult septic arthritis**
- **Early Dx vital bec. of cartilage damage**
- **Flexion - severely painful**
- **Synovial fluid BEFORE ABs!**
  - Turbidity almost always
  - **WBCs (most PMNs) + TP**
    - . WBCs > 30,000/ $\mu$ L
    - . > 90% PMNs
    - . TP > 2 mg/ml
  - Pos. culture definitive, **Negative common & doesn't R/O sepsis**
  - . **Assume infec. if  $\uparrow$  WBCs & TP** (synovial fluid)
- **Radiographs: not helpful acutely**
  - Early - soft tissue swelling, effusion
  - If no bone lesions re-rad in 7 ds
    - . Periosteal proliferation (DJD)
    - . Narrowing of joint space
  - **R/O Osteomyelitis** (see below)
- **Blood culture** m/b early in course of diz
- **FPT - zinc sulfate turbidity test for passive transfer**

**Emergency** (remove, bact. enzymes & material)

- **#1 Systemic ABs 2-3 wks**
  - If no gram stain, start on brd. spec. ABs, penicillin, ampicillin, tetracyclines, Change if C&S dictates
  - If no affect in 1-2 ds, more aggressive
- **Joint lavage** (remove material)
  - **Needle lavage early**
    - . Balanced electrolyte sol. + ABs
  - **Arthrotomy, debridement & lavage:** Penrose drains or suction drains to keep open, more helpful in stifle than complex carpus & tarsus
- **Sterile support bandages**
- **Rest** (for cartilage to heal & strengthen)
- **NSAIDs** (don't exceed recommended doses (ulcers))
- **Supportive care:** fluids for enteritis
- **IV plasma if FPT**

**Prognosis**  
• Poor/grave

**Prevention**  
• Colostrum early after birth

**Haemophilus somnus, Calves, Feedlot, Septicemic diz: TEME, Lungs, Joint**  
Infections in those that have averted fatal septicemia, **Septic arthritis** hock & stifle, Swollen joints & tendon sheaths, Poor condition, Stiffness

**Chlamydia polyarthritis**

BR-hb 437, BR 1143

\*\*

- **Chlamydia psittaci**
  - In soil & manure
- Endemically or epidemically in sheep, goats & calves
- Major importance to sheep industry
- Enters through umbilical stump

- Stiffness
- Shifting leg lameness
- Fever
- M/b keratoconjunctivitis

- History, CS
- Culture - easily seen
- Giemsa stained smears for elementary inclusion bodies
- FA, rising titers

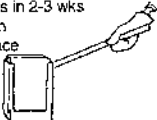

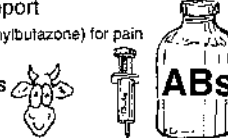

- Tetracycline (20 mg/kg IM/SQ EOD); 3 treatments
- Tylosin
- Erythromycin
- Do not medicate feed or water - reluctant to eat or drink

No vaccine

## Physal dysplasia, "Phyisit", "Epiphysitis"

IM 1250; BR 1437; Br 393; L 332

\*\*

- **Enlargement of growth plates**
  - Long bones
- Young, rapidly fattening cattle
  - 5-12 mo
  - Hindlimbs > FL
  - Carpus & fetlock esp.
- Cause - not exactly defined
  - Overnutrition
  - Copper defc (molybdenosis) in young growing cattle on pasture
  - Calves raised on slatted floors
  - Compression trauma to part of physal blood supply (metaphyseal) on med. side (weight bearing) m/ cause premature closure

- **Symmetrical swelling**
  - **Metaphyseal faring** (enlargement of ends of long bones)
  - Weight loss in beef cattle (9-18 mo)
  - Pain in enlarged area in lame calves or yearlings

- **Palpate swelling - warmth**
- **Mild pressure - none, mod. pain**
- **Deep palpation - severe pain**
- **Radiology (possible findings)**
  - Metaphyseal flaring
  - Widening of metaphysis
  - Sclerosis & lysis
- Lab
  - Usually normal
  - Hi ALP (alkaline phosphatase), but typical of growing animal

- **Copper related - diet changes**
- **Rest & lightweight cast**

- **Noncopper - salvage before more weight loss**

## Growth plates, Rapidly fattening young, Copper defc

CS: Symmetrical swelling, Wt. loss, Pain

Dx: Hx, CS, Rads

Tx: Copper; Salvage

- "Epiphysitis" - misnomer bec. **no active inflammation**
- Dysplasia of growth plate better term (growth plate, not epiphysis)
- Misnamed rickets - not related to Vit. D defc

## Prevention

- **Correct diet - copper**

## Sprains & Luxation

IM 1283; L 218, 267

\*\*

- **Sprain** - stretching or tearing of support lig. of a joint; Mild sprain: few fibers torn, integrity not lost; Moderate sprain: Part of lig. torn w/ some loss of function
  - Severe sprain: complete loss of function of lig. w/ separation of ends
- **Luxation: dislocation of joint**
- **Subluxation: partial dislocation**
  - Loss of integrity of 1 or more lig. (severe sprain); Avulsion txs of attachment of lig.
- Pathophysiology
  - **Instability leads to synovitis which leads to DJD**

- **Sprains variable:**
  - Mild sprain m/ go unnoticed
  - Moderate sprain: some laxity in joint
  - Severe sprain: instability of joint, m/b luxation of joint, extensive swelling, tenderness, lameness & weakness
- **Luxation**
  - **Obvious nonweight bearing lameness**
  - **Postural deformity**
  - Dislocation of joint
  - Instability of joint

- History, CS
- Radiographs
  - In stressed position
  - Variable opening of joint

## DDx:

- Catastrophic fx
- Osteomyelitis (p 174)
- Suppurative joint diz (p 172)

## Instability leads to synovitis & DJD

CS: Sprain-Variable; Lux.-3 legs, Deformed

Dx: Hx, CS, Rads

Tx: Prevent synovitis, Cold, Stabilize, Rest

## Prevent synovitis & DJD

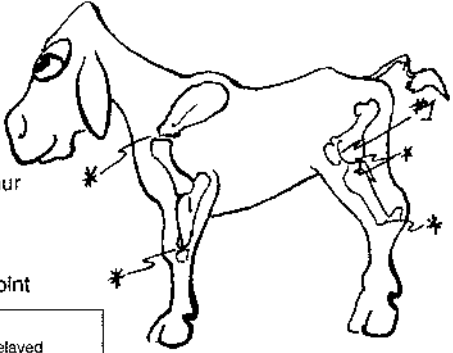

- 1 reduce swelling**
  - Cold water or ice as soon as possible (reduce hemorrhage & minimize swelling)
- 2. Stabilize or immobilize joint**
  - Mild: 4-sheet cotton dressing w/ flannel wrap; few days
  - More severe: heavy wraps or cast & stall confinement
- 3. Pain relief**
  - Phenylbutazone (up to 4 mg/kg OP or IV BID)
  - Reduce inflammation & relieve pain
- 4. Rest**

## Infectious uveitis \*\*\*

CST 837; Br 718; DC 461

• **Neonatal septicemia** - *E. coli*, *Corynebacterium* spp., *Klebsiella*, *Listeria*, *Salmonella*, *Strep. spp.*, **FPT** (failure of passive transfer) • **CS:** Corneal edema, episcleral vascular injection, cloudy ocular media, constricted pupil, iris congestion; **Septicemia CS** (fever, swollen joints, umbilical abscess, pneumonia, enteritis, endotoxemia)  
 • **Adult:** Uncommon, Systemic infec.: mastitis, metritis, endocarditis, **TEME** • **CS:** Fibrinous anterior uveitis, **CS** of suppurative diz; **TEME** - posterior uvea lesions; **Sequelae** synechiae & chorioretinal scars • **Tx:** Systemic ABs & support, Topical ABs or AB/steroid (if no ulcers) + 1% atropine QID

**MCF head & eye form.** ★ (Malignant catarrhal fever) (CST 838; IM 1368): See pg 10; Hi fever, conjunctivitis, miosis, corneal edema, exudate in anterior chamber • **Tx:** fatal, isolate & no sheep

**BVD-assoc. congenital ocular diz** ★★ (CST 838; IM 1369): fetus in 2nd trimester • **CS:** cerebellar hypoplasia/ocular lesions (retinal dysplasia, microphthalmia, cataracts, born blind, nystagmus)

**Listeriosis monocytogenes** (CST 838; IM 1370): encephalitis & ocular CS (facial paralysis, ptosis, conjunctivitis, med. strabismus, blindness, uveitis w/ hypopyon) • **Dx:** Isolate at necropsy • **Tx:** Brd spec. ABs early

**Retrolbulbar leukosis** ★ (CST 838; IM 1370; DC 445): M/ cause unilat. or bilat. exophthalmos, chemosis & exposure keratitis • **Px:** grave

## Cancer eye, Ocular squamous cell carcinoma (OSCC)

Mk 298; CST 847; IM 1392; BR-hb 879; BR 1721; DC 460; S-J 1193; S-T 293; S-N 69)

\*\*\*

• **#1 neoplasm of cattle & all large animals economically**  
 • **Benign & malignant**, premalignant stages  
 • 30% regress spontaneously  
 • **Cause, multifactorial, assoc w/:**  
 - Herefords, white-faced, Hereditary, **Sunlight, Dust, Hi nutrition**  
 • **Peak age 7-8 yr**  
 • **Common sites:** **Conjunctiva** (Lat. limbus (corneoscleral junction), Lower eyelid margin, 3rd eyelid (nictitating membr.), Med. canthus of eye, **Cornea**

## ORBITAL MASSES

• **Premalignant**  
 • **Plaques or papillomas**  
 - Benign, smooth, white  
 • **Malignant**  
 - Irregular, pink structures  
 - **Erosive & necrotic**, m/b foul odor  
 - Invasive into bone  
 - **Metastasis (rare) to parotid & cervical lymph nodes** (parotid cut at meat inspection)  
 • **Sequela**  
 - **Condemned carcasses** 12.5% due to OSCC, destroyed eye, bone invasion, necrosis, metastasis to parotid lnn., any cachexia. Remove head & pass body for those affected less than above

## Hx, CS - plaques or tumors

• **Confirm - impression smear cytology (rapid)**  
 • **Biopsy** - fix w/ 10% buffered formalin  
 • **Spatula** - topical, fixed w/ ethanol  
 • **Lymph node fine needle aspirate, Biopsy**  
 • **Benign:** Anuclear, keratinized squamous cells, coarse keratin w/ enlarged nuclei, Tend not to invade basement membrane  
 • **Malignant:** Bazaar, very large nuclei, Prominent nucleoli, invades basement membrane

• **Treat early**, 50% of precancerous lesions m/ regress spontaneously  
 • **Send to slaughter**  
 • **Remove tumor**  
 - Scrape plaques  
 - Cryosurgery (double freeze)  
 - Hyperthermia (122° F)  
 - **Enucleation** or  
 - Exenteration (removal of entire contents of orbit) in advanced lesions  
 - Radiation - not for field work  
 • **Recurrence common**

**Px: some fail to respond to Tx**

**Control**  
 • Hereditary, cull affected & offspring, select for adnexia pigment  
 • Shade, reduce dust  
 • **Tx early**  
 • **Tattoo nonpigmented lids**

**#1 \$ tumor - Herefords, Condemned carcasses**

**CS: Benign, Malignant (irregular, Necrotic)**

**Dx: Hx, CS, Lab**

**Tx: Remove (Scrape, Enucleation), Slaughter**

## DDx

- Trauma
- Infection
- Pink eye (p 178)
- Ocular dermoid
- Fibroma, fibrosarcoma
- Lymphosarcoma

**Facial nerve paralysis: \*\*\*** Cause: trauma or middle ear infections can result in keratoconjunctiva sicca (dry eye) due to disruption of innervation to

IM 1172; DC 435; N-L 162

lacrimal gland & inability to close eye

## Eyeworm, \* Thelaziasis

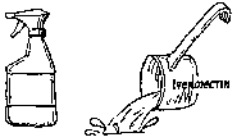

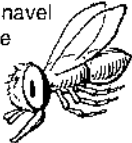

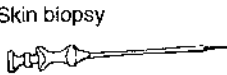

Mk 304; CST 838; BR 1276; Br 755; IM 1390

• **Thelazia spp** *T. gluosa*, *T. skrjabini*, *T. rhodesii* (most harmful), < 1" long, in 1/3 of all cattle in USA. **Face fly, Musca autumnalis**, common vector (feeds on eye excretions, deposits worm) Found invading lacrimal gland & ducts, gland of 3rd eyelid, nasolacrimal ducts, on cornea, in conjunctival sac, under eyelids  
 • **CS:** **Asymptomatic** typical in USA; Europe & Asia - conjunctivitis, photophobia & keratitis  
 • **Dx:** Visualization, **Incidental finding during surgery**  
 • **Tx:** **Not usually necessary (asymptomatic)**, if found mechanical removal following instillation of local anesthetic, ABs/steroid ointment for inflammation, Levamisole & Ivermectin

## Parasites

**Mange, \*\*\*  
Barn Itch**

Mk 812; IM 1423; BR-hb 507; BR 1304; Br 250, 682; Plc 32

**Reportable, Damages skin, Hypersensitivity, 2° bact. infec.**  
**CS: Pruritus, Econ. losses (Hide damage, ↓ Body condition, ↓ Milk prod.**  
**Dx: Hx, CS, Multiple skin scraping/biopsy**  
**Tx: Insecticides, Ivermectin • Reportable disease •**

**Chorioptic mange, leg, foot tail, scrotal mange**  
 Symbiotic scab  
 DC 247  
**\*\*\***

- **Chorioptes bovis** - round bodies, long legs & short, unsegmented pedicles - Surface dwelling - hypersensitivity
- **Most common cattle mange**
- **Winter stabled dairy - NE USA**
- "Leg mange" if starts on legs

- **Variable pruritus**
- **Papules, crusts & scabs, alopecia**
  - Winter: Perineum, caud. udder, thigh
  - Summer: Coronary band, interdigital space, muzzle

• Skin scrapings (easy)

**Location**

- Chorioptes & sarcoptes in stratum corneum
- Psoroptes in hair follicle
- Demodex in hair follicle & sebaceous glands

- **Report to feds**
    - Crotoxphos (spray 0.25%) once
    - Lime sulfur 2% 4 wkly TxS
    - Ivermectin
- 

**• Reportable •**

**Psoroptic mange,**  
 Common scabies,  
 Body mange  
**\***

- **Psoroptes ovis** - round bodies & segmented pedicles, Life cycle 10-12 d
- **Feedlot & range cattle**
- **Central & western states**
- **Eradication from sheep in USA**

- **Pruritus, papules, pustules, crusts, scabs**
  - Generalized crusting dermatosis
- **Starts on withers, spreads to entire body**
- **Death in untreated calves & yearlings m/b**
- **Chronic or acute in young dairy during winter**

• Skin scrapings

**• Reportable •**

- **Reportable diz USDA**
    - Isolate, quarantine & Tx
    - Ivermectin SQ, Dipping
- 

**Sarcoptic mange,**  
 Barn itch, head mange  
**\*\*\***

- **Sarcoptes scabiei var bovis**
  - Round bodies, terminal anus, short legs & long, unsegmented pedicles
  - Burrowing
- **Reportable**
- **Uncommon in ruminants, important in pigs**
- **Can be transmitted to man**
- **Transmission: direct contact (m/b fomites)**

- **Pruritus**
  - **Starts on head & neck, spreads**
  - **Squamous, crusted skin**
  - **Skin thickens & forms large folds**
  - **Damage of a single mite is tremendous**
  - **Can generalize if not treated**
- 

• Vacuum cleaner, filter sampling, ear swabs > skin scrapings or biopsy

- **Report to feds**
  - **Ivermectin single SQ injection**
- 

**• Reportable •**

**Demodex, \*\*  
Follicular mange,  
Demodicosis,  
Demodectic  
mange**

- **Rare**
- **Demodex spp** - cigar shape w/ short, stubby legs
  - Normal resident of skin, live in hair follicle & sebaceous glands, not contagious diz
- **Rare in lg. animals**
- **Holstein dairy cattle most commonly**
- **Transmission: cow to calf at nursing**
- **Possible hereditary predisposition**

- **Asymptomatic usually**
- **Nonpruritic**
- **Lesions on face, neck & shoulder**
- **Rarely spreads over entire body**
- **Sm. papules & nodules**
  - **White waxy material** can be expressed (contains mites)
- **Some thick skin & crusts, forms heavy folds**

• **Incise nodules & examine (microscope)**

- **Usually asymptomatic so not treated**
  - **Neguvon® (trichlorfon) whole body dipping 3 TxS EOD**
  - **Severely affected culled**
- 

**Psorergatic mange (cattle itch mite)**  
**\***

- **Rare**

- **Nonpruritic, scaling**

- **Minimal lesions & low economic loss. so usu. none**

Heel fly larvae, Migrate, Overwinter, Migrate out back  
 CS: #1 hide damage, Wt. loss, Anaphylaxis, CNS  
 Tx: Pour on OPs, Ivermectin before Oct. 15th

"Gadding about": wild running w/ tails in air, herd stampedes out of fear of "Heel" flies (don't bite, but scare w/ buzz)

**Life cycle 9-12 months**  
 "Heel fly" season, late spring or early summer  
 • Attach eggs to hair of cattle (lower limbs)  
 • Eggs hatch, enter skin & migrate  
 - *H. bovis* to spinal cord region in epidural fat  
 - *H. lineatum* to esophagus  
 • Stay over winter 2-4 months  
 • 2nd migration to back Jan - Feb  
 - Create breathing holes in skin  
 - Warbles (cysts) around larvae  
 • 3rd stage emerge & drop to ground, 1-3 months flies emerge  
 • Adults live < 1 week (chase cattle's heels)

## Dermatophilosis, Cutaneous streptotrichosis

Mk 787; C3T 894; IM 1411; BR-hb 337; BR 857; DC 228; Derm 136

\*\*\*

- Common supf. bact infec.
- Contagious diz
- **Dermatophilus congolensis** (gram +, branching aerobic organism)
- Zoospores germinate in moist damaged skin to form mycelium
- Mycelium proliferates in living skin
- Suspected in soil, but can't be isolated
- Transmission: Direct contact w/ reservoir host, fomites or insects, crusts
- Crusts contain org. up to 42 mos
- Accounts for repeated outbreaks
- Predisposing factors
- Macerated/traumatized skin
- Rainy season (wet damages skin)
- External parasites
- Nonhygienic conditions

**Bacteria; Damaged skin + Zoospores**  
**CS: Crusts & Pus, "Paintbrush"**  
**Dx: Hx, CS, Smear - "Railroad tracks"**  
**Tx: Topical bath - Keep dry**

- Proliferative, suppurative crusts
- Pus under yellow crusts
- "Paintbrush" appearance (pus matted hair)
- Painful, non pruritic
- Hair breaks & falls off (infected area)
- Rump & topline, dist. extremities; face (calves - milk scald), brisket, axilla, groin, udder, teats, scrotum, prepuce, perineum, tail
- Chronic/healing stage: dried crusts, scaling & alopecia similar to ringworm
- > 50% of body: wt. loss, dehydration
- Death
- if untreated, can generalize, esp. in calves
- Udder infections can stop animals from being milked out appropriately

### DDx:

- Mange (p 181)
- Ringworm (p 185)
- Pseudorabies (p 141)

- Presume cutan. crusts due to dermatophilus until proven otherwise

- Direct smear of pus
- Minced preps of crust, on slide (microscope)
- Stain w/ Diff-Quik®
- "Railroad tract" long chains of cocci, branching, filamentous
- If neg., submit crusts or punch biopsy to a microbiologist before rule out

- Remove crusts w/ brush & mild soap
- Dispose of infective crusts
- Topical total body washes daily for 5 d, then weekly until healed
- Betadyne® (povidone-iodine) shampoo
- Copper sulfate 0.2%, 1 if potassium aluminum sulfate
- Severe or generalized infection
- LA 200 2 doses 48 hrs apart

### Prognosis

- Good
- Poor if > 50% of body

### Prevention

- Remove underlying factors
- Moist conditions, parasites that damage supf. layers of skin
- Ear tags for parasites
- Keep dry

## Dermatophytosis, Dermatomycoses • See pg 185; This fungal diz ("Ringworm") is mentioned here bec. of similarity of name w/ Dermatophilus (bacteria)

### Ulcerative lymphadenitis, \*

#### Cutaneous abscesses,

Mk 66; IM 1251; BR-hb 241, 275; C3T 896; BR 553, 655; Br 579; Pic 39, S-J 138; DC 476; Derm 133

- Rare in cattle, Common in sheep & goats
- *Actinomyces (Corynebacterium) pseudotuberculosis* (gram pos. pleomorphic rod)
- Herd problem, sporadic
- Cen. & S. California
- Late summer to winter

- Ventral lymphadenitis
- Large ulcers of skin on lat. body, neck & face (8" in diameter)
- "Spongy" necrotic debris
- Ulcerative dermatitis
- No significant illness

- History, CS
- Isolation of *A. pseudotuberculosis*

- Spontaneous healing often
- Limited topical Tx

### Folliculitis/ Furunculosis \*

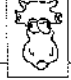

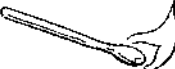

Mk 828; IM 1413; C3T 896; BR-hb 240; BR 550; Derm 126

- Rare in cattle, common in goats & sheep; inflam. of hair follicles (folliculitis [inflam. of hair follicle], furunculosis [inflammation of follicle & surrounding dermis]), #1 Staph, trauma & poor hygiene
- CS: Tail & perineum lesions, less common on scrotum & face, pruritus & pain variable
- Tx: topical cleaning, drying, systemic ABs, Chlorhexidine 5-7 days, then 2 x/week until resolves

## Miscellaneous

## Ringworm, Dermatomycosis

Mk 791; C3T 890; IM 1419; BR-hb 447; BR 1164; Br 680; DC 226  
**\*\*\***

- **Mycotic - fungal**
- ***Trichophyton verrucosum*** (gram + branching, aerobic organism)
- Saprophyte in soil
- Calves >> adults
- Winter stabled animals anytime

- **Ringlike lesions** (as spread centrifugally)
- **Multifocal lesions**
- **Alopecia** (hair breaks & falls off)
- **Scaling**
- **Crusting excessive** - Wartlike
- Head, around eyes, neck, shoulders & sides of thorax
- No pain or pruritus

- **CS - alopecia & crusts**
- **Fungal cultures** (of broken hairs at periphery, not crusts)
  - Dermatophyte test media
  - Skin scrapings (hyphae & spores)

### DDx

- Mange (p 181)
- *Dermatophilus congolensis* (p 183)
- Pseudorabies (p 141)

- **Self limiting**, 6-12 wks, or when let out to pasture in spring
- **Fungal products topical** to decr. spread
  - Betadine®, tamed iodine shampoos, thiabendazole's paste (Tresaderm®), lime sulfur sol, Captan, Iodophors
- **Systemic Tx controversial**, Griseofulvin, not recommended

**Trichophyton, Winter stabled**  
**CS: Ring lesions (Crusts, Alopecia)**  
**Dx: Hx, CS, Cultures, Scrapings**  
**Tx: Self limiting, Antifungals**

## Mycetoma, Granulomatous skin infec. (C3T 892; BR-hb 242, BR 556, IM 1421)

### • Eumycotic mycetoma \*

- **Rare**; Fungi, Penetrating wound, *Drechslera* spp, *Helminthosporium* spp
- **CS**: Nasal granulomas, ulcerative, suppurative & fibrotic, **Ulcerative nodules** (rump, thigh, tail, ears &/or vulva)
- **Tx**: None reported

### • Actinomycotic mycetomas \*\*\*

- **Mycetomas** caused by bacterial granulomatous infec (Nocardia, Actinomycetes & Actinobacillus) entering through wounds
- **CS**: Swellings, Draining sinuses, Granules
- **Dx**: Cytology, culture, biopsy
  - Nocardia: beaded, gram pos. branching filaments & bacillary forms
  - Actinomycetes: small filaments, rods & cocci, gram pos.
  - Actinobacilli: gram neg. bacilli
- **Tx**: **Iodides**, sulfonamides, tetracyclines, triple sulfas, streptomycin, penicillin, isonazide - variable results

**Bovine farcy** (C3T 892): Nocardia: Painless, firm, SQ nodules (limbs, head, neck), Ulcerative, odorless, thick, cheesy, gray or yllw exudate, lymphadenitis & regional lymphadenopathy

**Actinomycosis** (Lumpy jaw) See pg 13

**Actinobacillus** (Wooden tongue) See pg 13

### Pythiosis, Phycomycosis

C3T 893 \*

- **Rare**; Fungus - Pythium spp. (Hyphomycetes). Aquatic fungi w/ aquatic motile zoospores, Summer & fall in tropical & temperate areas
- **CS**: SQ fungal infec. (Dist. extremities or ventrum usually), focal ulceration w/ dermal thickening, draining tracts, watery, purulent exudation, periarticular swelling
- **Dx**: Biopsy & culture, multifocal pyogranulomas (branching hyphae) surrounded, Cultured on Sabouraud's dextrose agar
- **Tx**: Not enough data, Sx extirpation & amphotericin B in horses (too expensive in cattle)

### Aspergilliosis

C3T 893

\*

- **Rare**; Ubiquitous in soil, skin; monomorphic mold, microconidia (spores); Predisposing: stress, prolonged AB therapy, Immunodeficiency
- **CS**: Primary dz of Resp., GI, Mastitis, Abortion; Skin rare (SQ granuloma)
- **Dx**: repeated isolation bec. common flora of skin
- **Tx**: None reported in large animals

**Mycotoxiosis** \* (C3T 906): Ergotism, Fescue toxicosis, Stachybotryotoxicosis

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
-----------	-------------	-----------------	-----------	-----------

**Viral diz w/ skin lesions** (C3T 899): Generalized viral dizes that have skin lesions as part of their presentation

**Bovine papular stomatitis:**  
See pg 8; Worldwide, papules, crusts on muzzle, nostrils, lips; Self limiting

**Bluetongue:** See pg 10; mainly sheep diz, indistinguishable from vesicular stomatitis & foot-&-mouth diz

**Infect. bovine rhinotracheitis (IBR):** See pg 82; Herpesvirus 1, Resp/Enteric/CNS/Abortions; Skin lesions: erythema ("red nose"), pustules, necrosis & ulceration of muzzle &/or vulva

**Foot & mouth diz:** See pg 11; picornavirus, highly contagious diz; Skin CS: vesicles on mouth, muzzle, nostrils, coronet, interdigital space, udder & teats; hooves m/b sloughed

**Rinderpest:** see pg 9; Exotic, highly contagious diz of ruminants & swine

**Malignant catarrhal fever:** See pg 10, sporadic, highly fatal systemic diz; Skin CS: erythema, scaling, necrosis, ulceration of muzzle, face, udder, teats, vulva & scrotum; oozing necrosis of perineal, axillary, inguinal & back regions

**Pseudorabies:** See pg 141; rapidly fatal diz, herpesvirus, intense pruritus & frenzied rubbing, chewing, kicking affected skin

**BVD:** See pg 22; pestivirus, GI/Resp/Chronic diz; Skin CS: Erosions, necrosis of muzzle, lips, nostrils, vulva, prepuce, coronet & interdigital space; M/b alopecia of perineum, thighs & neck

**Vesicular stomatitis:** see pg 11; Rhabdovirus, identical to foot & mouth diz; Reportable

**Bovine pseudolumpy skin diz** (C3T 899; DC 230; Derm 108): Herpesvirus 2; • CS: multiple, slightly raised plaques & nodules, supf. in skin, central depression & supf. necrosis

**Pseudo-cowpox, Milker's nodules, Paravaccinia**  
Mk 823; C3T 898; IM 1418; BR-hb 434; BR 1135; Br 322; DC 276; Derm 102  
\*\*\*

- Mild infection of udder & teats
- Parapoxvirus (related to BPS)
- Widespread, worldwide
- Slowly spreads through herd
- Little immunity develops (re-infects on subsequent lactations)
- Common in U.S. & difficult to distinguish from pox lesions

- Small red papules on teats & udder to vesicles or pustules
- Scab (removed w/o pain), granulation beneath scabs, heats from center
- Horseshoe or circular ring of scabs
- M/ persist for mos, rough teats
- Deep ulceration rare
- Also on udder, med. thigh or scrotum
- Incr. incidence of mastitis

- CS: Scabs confused w/ others
- Horseshoe scab pathognomonic
- Electron microscope for viral particles (sure!)

- Control spread
  - Hygiene
  - Segregation
- Prognosis: Good

**Mild infec. udder & teats, Like cowpox**  
CS: Horseshoe scabs  
Dx: Hx, CS, Horseshoe scabs  
Tx: Control spread (Segregate & Hygiene)

**DDx**  
• Bovine herpes mamillitis (p 187)  
• Bovine papular stomatitis (p 8)  
• Warts (p 190)  
• Traumatic injuries  
• Rare (vaccinia, cowpox & horsepox)

**PH**  
**Public health**  
• Man - infected - painless, but itchy, purplish red nodules on fingers & hands, disappear in weeks

**Cowpox** (Mk 823; C3T 898, Br-hb 433; BR 1133; Br 323; Derm 99) • Extremely rare, reported in Europe, Poxvirus, related to vaccinia & smallpox • CS: Raw ulcerations, Scabs on teats & udder; Public health
